TAS Signal Box

The TAS 'Signal Pop-up Box' is a **visual, automated trading signal delivery system** which provides trading signals to a user's computer desktop in real time. The signal is delivered from TAS to the user's computer screen via an automated 'pop-up' box which tells the user what to trade, when, and how much. In addition, it automatically tracks the current positions. This method of delivering TAS Trade Room signals or automated trading strategy signals is for the trader who treats trading as a full time job or wants to take or not take certain signals based partly on his own criteria.

The client application (pictured below), is what the end-user of the generated market signals will see on their desktop (any PC with Windows XP or above). When a signal arrives, the application will maximize (if minimized), play a sound, and display the signal information to the user. The current signal is shown in the large boxes at the top of the application (*green* for BUY/COVER, *red* for SELL/SHORT) with the name of the symbol, current bid price, number of contracts/shares, and suggested action. Each signal is also placed in the middle window (most recent on top), showing the same information along with how many seconds ago that signal took place. This time delay information is useful for clients who have been away from their computer and would like to know how recently a signal has arrived. Current Positions are shown below in the next window.

Automatic signal delivery	User can be doing any other task a nd only has to look at box when a trade signal arrives – frees up user's time from staring at computer screen – saves time.
Operates in real time	No lag time means you get the best entry points and don't 'miss a move' in the markets.
Easy-to-read	Requires no special training – easy to see & read Pop-up box even if busy with other tasks.
Stand alone product	Requires no purchase or use of additional software or services – saves money.
