### Present Value and The Opportunity Cost of Capital

# **Chapter 2**

# **Topics Covered**

- Present Value
- Net Present Value
- NPV Rule
- ROR Rule
- Opportunity Cost of Capital
- Managers and the Interests of Shareholders

### **Present Value**

#### Present Value

Value today of a future cash flow.

#### **Discount Factor**

Present value of a \$1 future payment.

#### **Discount Rate**

Interest rate used to compute present values of future cash flows.

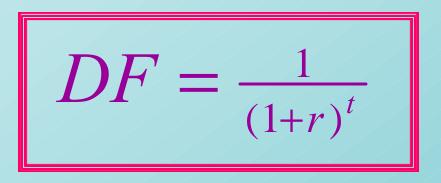

### **Present Value**

### Present Value = PV

## $PV = discount factor \times C_1$

### **Present Value**

#### Discount Factor = DF = PV of \$1

Discount Factors can be used to compute the present value of any cash flow.

# Valuing an Office Building

#### Step 1: Forecast cash flows

Cost of building =  $C_0 = 350$ Sale price in Year 1 =  $C_1 = 400$ 

*Step 2: Estimate opportunity cost of capital* If equally risky investments in the capital market offer a return of 7%, then

Cost of capital = r = 7%

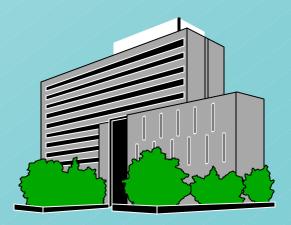

# Valuing an Office Building

#### Step 3: Discount future cash flows

$$PV = \frac{C_1}{(1+r)} = \frac{400}{(1+.07)} = 374$$

Step 4: Go ahead if PV of payoff exceeds investment

### NPV = -350 + 374 = 24

### Net Present Value

### NPV = PV - required investment

# $NPV = C_0 + \frac{C_1}{1+r}$

# **Risk and Present Value**

- Higher risk projects require a higher rate of return.
- Higher required rates of return cause lower PVs.

PV of 
$$C_1 = $400 \text{ at } 7\%$$
  
PV  $= \frac{400}{1+.07} = 374$ 

### **Risk and Present Value**

PV of 
$$C_1 = $400 \text{ at } 12\%$$
  
PV  $= \frac{400}{1+.12} = 357$ 

PV of 
$$C_1 = $400 \text{ at } 7\%$$
  
PV  $= \frac{400}{1+.07} = 374$ 

 Accept investments that offer rates of return in excess of their opportunity cost of capital.

<u>Example</u>

In the project listed below, the foregone investment opportunity is 12%. Should we do the project?

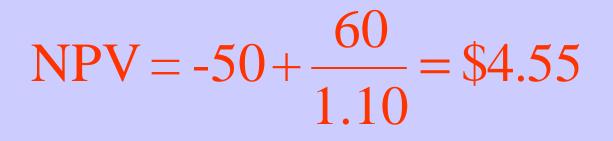

Return = 
$$\frac{\text{profit}}{\text{investment}} = \frac{400,000 - 350,000}{350,000} = .14 \text{ or } 14\%$$

# Net Present Value Rule

Accept investments that have positive net present value.

<u>Example</u>

Suppose we can invest \$50 today and receive \$60 in one year. Should we accept the project given a 10% expected return?

#### <u>Example</u>

You may invest \$100,000 today. Depending on the state of the economy, you may get one of three possible cash payoffs:

EconomySlumpNormalBoomPayoff\$80,000110,000140,000

Expected payoff =  $C_1 = \frac{80,000 + 100,000 + 140,000}{3} = \$110,000$ 

#### Example - continued

The stock is trading for \$95.65. Depending on the state of the economy, the value of the stock at the end of the year is one of three possibilities:

Economy	Slump	Normal	Boom
Stock Price	\$80	110	140

Example - continued

*The stocks expected payoff leads to an expected return.* 

Expected payoff =  $C_1 = \frac{80 + 100 + 140}{3} = $110$ 

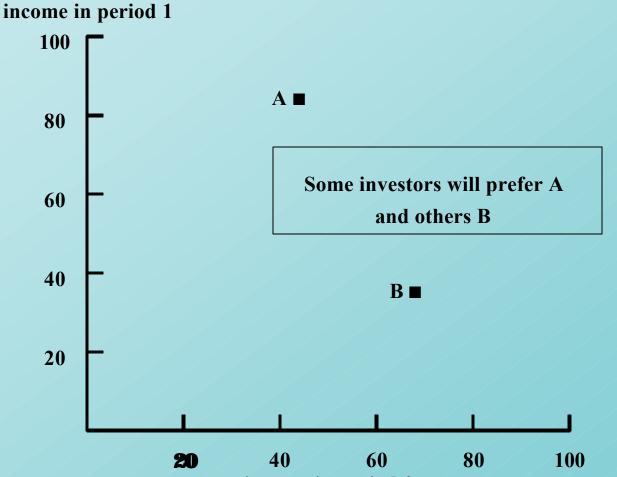

Expected return =  $\frac{\text{expected profit}}{\text{investment}} = \frac{110 - 95.65}{95.65} = .15 \text{ or } 15\%$ 

#### Example - continued

Discounting the expected payoff at the expected return leads to the PV of the project.

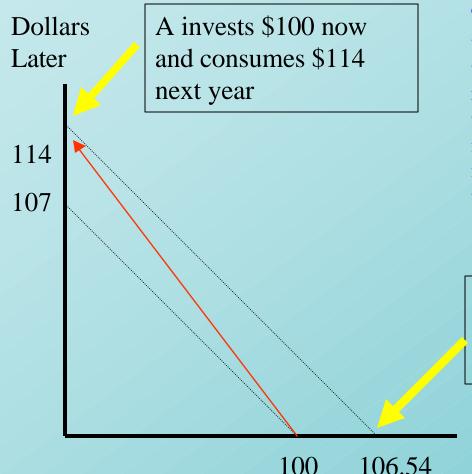

# $PV = \frac{110,000}{1.15} = \$95,650$

 Some people prefer to consume now. Some prefer to invest now and consume later.
 Borrowing and lending allows us to reconcile these opposing desires which may exist within the firm's shareholders.

income in period 0

The grasshopper (G) wants to consume now. The ant (A) wants to wait. But each is happy to invest. A prefers to invest 14%, moving up the red arrow, rather than at the 7% interest rate. G invests and then borrows at 7%, thereby transforming \$100 into \$106.54 of immediate consumption. Because of the investment, G has \$114 next year to pay off the loan. The investment's NPV is \$106.54-100 = +6.54

The grasshopper (G) wants to consume now. The ant (A) wants to wait. But each is happy to invest. A prefers to invest 14%, moving up the red arrow, rather than at the 7% interest rate. G invests and then borrows at 7%, thereby transforming \$100 into \$106.54 of immediate consumption. Because of the investment, G has \$114 next year to pay off the loan. The investment's NPV is \$106.54-100 = +6.54

G invests \$100 now, borrows \$106.54 and consumes now.

Dollars Now

## **Managers and Shareholder Interests**

- Tools to Ensure Management Responsiveness
  - → Subject managers to oversight and review by specialists.
  - → Internal competition for top level jobs that are appointed by the board of directors.
  - → Financial incentives such as stock options.

#### **Principles of Corporate Finance**

**Brealey and Myers** 

**Sixth Edition** 

#### How to Calculate Present Values

# **Chapter 3**

# **Topics Covered**

- Valuing Long-Lived Assets
- PV Calculation Short Cuts
- Compound Interest
- Interest Rates and Inflation
- Example: Present Values and Bonds

### **Present Values**

### Discount Factor = DF = PV of \$1

$$DF = \frac{1}{(1+r)^t}$$

 Discount Factors can be used to compute the present value of any cash flow.

### **Present Values**

$$PV = DF \times C_1 = \frac{C_1}{1 + r_1}$$

$$DF = \frac{1}{(1+r)^t}$$

 Discount Factors can be used to compute the present value of any cash flow.

### **Present Values**

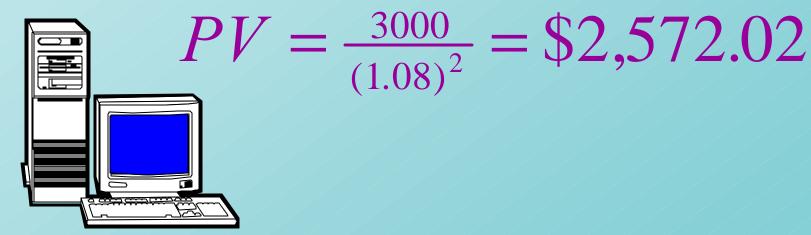

$$PV = DF \times C_t = \frac{C_t}{1 + r_t}$$

 Replacing "1" with "t" allows the formula to be used for cash flows that exist at any point in time.

#### <u>Example</u>

36

You just bought a new computer for \$3,000. The payment terms are 2 years same as cash. If you can earn 8% on your money, how much money should you set aside today in order to make the payment when due in two years?

 PVs can be added together to evaluate multiple cash flows.

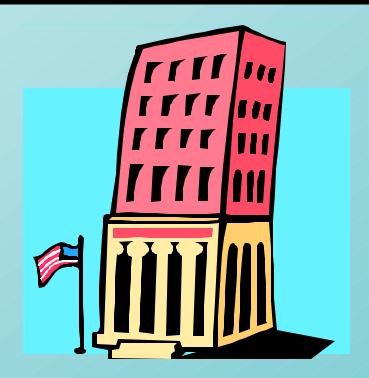

$$PV = \frac{C_1}{(1+r)^1} + \frac{C_2}{(1+r)^2} + \dots$$

 Given two dollars, one received a year from now and the other two years from now, the value of each is commonly called the Discount Factor. Assume r<sub>1</sub> = 20% and r<sub>2</sub> = 7%.

$$DF_1 = \frac{1.00}{(1+.20)^1} = .83$$
$$DF_2 = \frac{1.00}{(1+.07)^2} = .87$$

#### **Example**

Assume that the cash flows from the construction and sale of an office building is as follows. Given a 7% required rate of return, create a present value worksheet and show the net present value.

Year 0Year 1Year 2-150,000-100,000+ 300,000

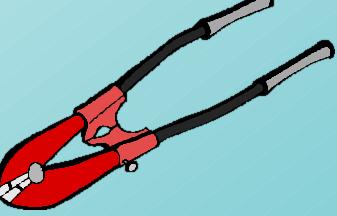

#### **Example - continued**

Assume that the cash flows from the construction and sale of an office building is as follows. Given a 7% required rate of return, create a present value worksheet and show the net present value.

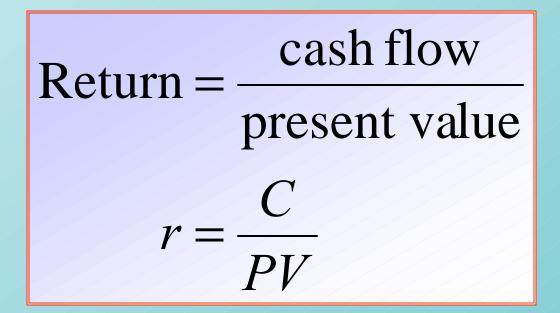

Period	Discount	Cash	Present	
	Factor	Flow	Value	
0	1.0	-150,000	-150,000	
1	$\frac{1}{1.07} = .935$	-100,000	-93,500	
2	$\frac{1}{(1.07)^2} = .873$	+300,000	+261,900	
		NPV = Total =	\$18,400	I

 Sometimes there are shortcuts that make it very easy to calculate the present value of an asset that pays off in different periods. These tolls allow us to cut through the calculations quickly.

<u>*Perpetuity*</u> - Financial concept in which a cash flow is theoretically received forever.

# <u>*Perpetuity*</u> - Financial concept in which a cash flow is theoretically received forever.

# <u>Annuity</u> - An asset that pays a fixed sum each year for a specified number of years.

**PV of annuity** = 
$$C \times \left[\frac{1}{r} - \frac{1}{r(1+r)^t}\right]$$

# **Annuity Short Cut**

#### <u>Example</u>

You agree to lease a car for 4 years at \$300 per month. You are not required to pay any money up front or at the end of your agreement. If your opportunity cost of capital is 0.5% per month, what is the cost of the lease?

# **Annuity Short Cut**

#### **Example - continued**

You agree to lease a car for 4 years at \$300 per month. You are not required to pay any money up front or at the end of your agreement. If your opportunity cost of capital is 0.5% per month, what is the cost of the lease?

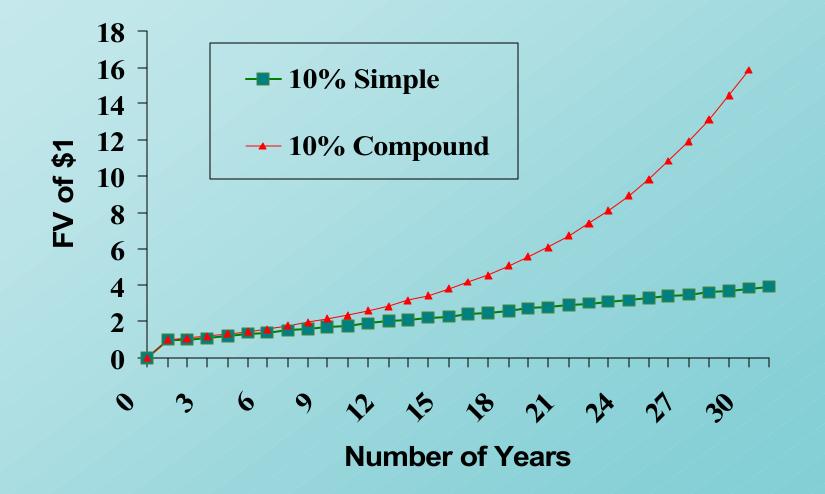

Lease Cost = 
$$300 \times \left[ \frac{1}{.005} - \frac{1}{.005(1+.005)^{48}} \right]$$
  
Cost = \$12,774.10

# **Compound Interest**

i	ii	iii	iv v	
Periods Interest				nnually
per	per	APR		mpounded
<u>year</u>	period	<u>(i x ii)</u>	<u>one year</u> in	terest rate
1	6%	6%	1.06	6.000%
2	3	6	$1.03^2 = 1.0609$	6.090
4	1.5	6	$1.015^4 = 1.06136$	6.136
12	.5	6	$1.005^{12} = 1.06168$	6.168
52	.1154	6	$1.001154^{52} = 1.06180$	6.180
365	.0164	6	$1.000164^{365} = 1.06183$	6.183

### **Compound Interest**

<u>Inflation</u> - Rate at which prices as a whole are increasing.

Nominal Interest Rate - Rate at which money invested grows.

<u>Real Interest Rate</u> - Rate at which the purchasing power of an investment increases.

# $1 + \text{real interest rate} = \frac{1 + \text{nominal interest rate}}{1 + \text{inflation rate}}$

# $1 + \text{real interest rate} = \frac{1 + \text{nominal interest rate}}{1 + \text{inflation rate}}$

approximation formula

Real int. rate  $\approx$  nominal int. rate - inflation rate

#### <u>Example</u>

If the interest rate on one year govt. bonds is 5.9% and the inflation rate is 3.3%, what is the real interest rate?

#### <u>Example</u>

If the interest rate on one year govt. bonds is 5.9% and the inflation rate is 3.3%, what is the real interest rate?

1 + real interest rate =  $\frac{1+.059}{1+.033}$  Savings 1 + real interest rate = 1.025 Bond

real interest rate = .025 or 2.5%

<u>Example</u>

If the interest rate on one year govt. bonds is 5.9% and the inflation rate is 3.3%, what is the real interest rate?

1 + real interest rate =  $\frac{1+.059}{1+.033}$  Savings 1 + real interest rate = 1.025 Bond

real interest rate = .025 or 2.5%

Approximation =.059-.033 =.026 or 2.6%

# Valuing a Bond

#### <u>Example</u>

If today is October 2000, what is the value of the following bond?

- An IBM Bond pays \$115 every Sept for 5 years. In Sept 2005 it pays an additional \$1000 and retires the bond.
- The bond is rated AAA (WSJ AAA YTM is 7.5%).

Cash FlowsSept 01020304051151151151151115

# Valuing a Bond

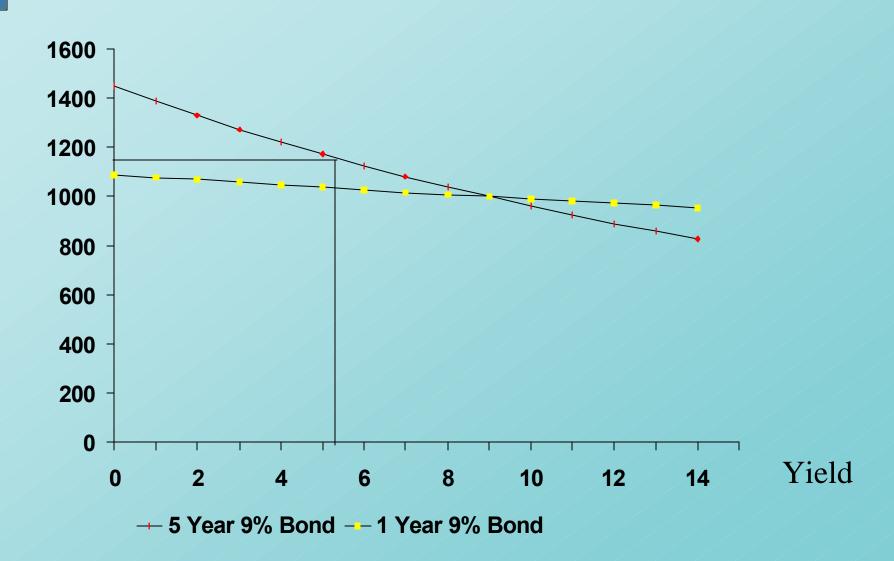

#### **Example continued**

If today is October 2000, what is the value of the following bond?

- An IBM Bond pays \$115 every Sept for 5 years. In Sept 2005 it pays an additional \$1000 and retires the bond.
- The bond is rated AAA (WSJ AAA YTM is 7.5%).

$$PV = \frac{115}{1.075} + \frac{115}{(1.075)^2} + \frac{115}{(1.075)^3} + \frac{115}{(1.075)^4} + \frac{1,115}{(1.075)^5}$$

**Sixth Edition** 

#### The Value of Common Stocks

### **Chapter 4**

# **Topics Covered**

- How To Value Common Stock
- Capitalization Rates
- Stock Prices and EPS
- Cash Flows and the Value of a Business

### **Stocks & Stock Market**

<u>Common Stock</u> - Ownership shares in a publicly held corporation.

- <u>Secondary Market</u> market in which already issued securities are traded by investors.
- <u>Dividend</u> Periodic cash distribution from the firm to the shareholders.
- <u>P/E Ratio</u> Price per share divided by earnings per share.

### **Stocks & Stock Market**

Book Value - Net worth of the firm according to the balance sheet.

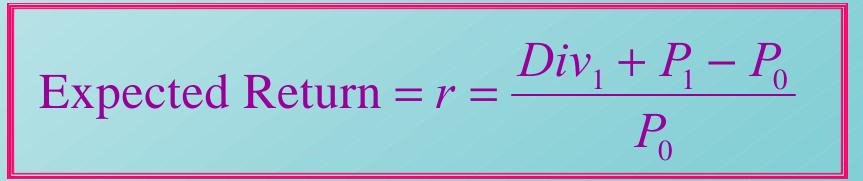

- <u>Liquidation Value</u> Net proceeds that would be realized by selling the firm's assets and paying off its creditors.
- <u>Market Value Balance Sheet</u> Financial statement that uses market value of assets and liabilities.

<u>Expected Return</u> - The percentage yield that an investor forecasts from a specific investment over a set period of time. Sometimes called the *market capitalization rate*.

Expected Return - The percentage yield that an investor forecasts from a specific investment over a set period of time. Sometimes called the *market capitalization rate*.

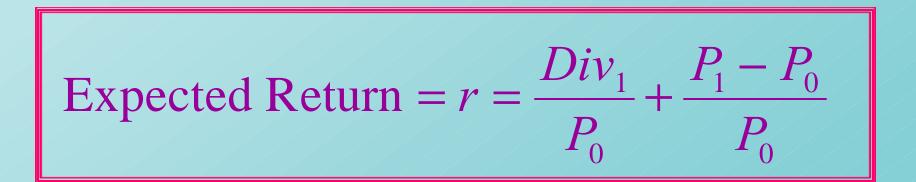

The formula can be broken into two parts.

Dividend Yield + Capital Appreciation

The formula can be broken into two parts.

Dividend Yield + Capital Appreciation

<u>Capitalization Rate</u> can be estimated using the perpetuity formula, given minor algebraic manipulation.

<u>Capitalization Rate</u> can be estimated using the perpetuity formula, given minor algebraic manipulation.

Capitaliza tion Rate =  $P_0 = \frac{Div_1}{r-g}$ =  $r = \frac{Div_1}{P_0} + g$ 

#### **Return Measurements**

Dividend Yield = 
$$\frac{\text{Div}_1}{P_0}$$

Return on Equity = 
$$ROE$$
  
 $ROE = \frac{EPS}{Book Equity Per Share}$ 

<u>Dividend Discount Model</u> - Computation of today's stock price which states that share value equals the present value of all expected future dividends.

<u>Dividend Discount Model</u> - Computation of today's stock price which states that share value equals the present value of all expected future dividends.

$$P_0 = \frac{Div_1}{(1+r)^1} + \frac{Div_2}{(1+r)^2} + \dots + \frac{Div_H + P_H}{(1+r)^H}$$

H - Time horizon for your investment.

#### Example

Current forecasts are for XYZ Company to pay dividends of \$3, \$3.24, and \$3.50 over the next three years, respectively. At the end of three years you anticipate selling your stock at a market price of \$94.48. What is the price of the stock given a 12% expected return?

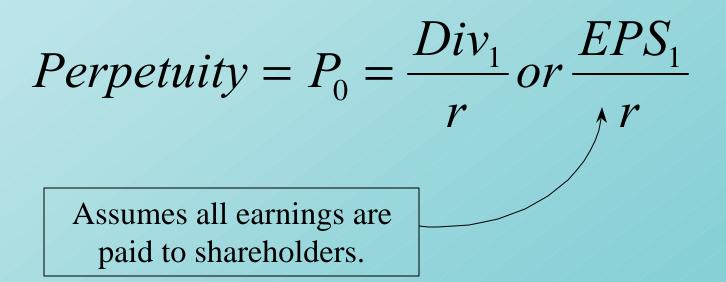

#### Example

Current forecasts are for XYZ Company to pay dividends of \$3, \$3.24, and \$3.50 over the next three years, respectively. At the end of three years you anticipate selling your stock at a market price of \$94.48. What is the price of the stock given a 12% expected return?

$$PV = \frac{3.00}{(1+.12)^{1}} + \frac{3.24}{(1+.12)^{2}} + \frac{3.50+94.48}{(1+.12)^{3}}$$
$$PV = \$75.00$$

If we forecast no growth, and plan to hold out stock indefinitely, we will then value the stock as a **PERPETUITY**.

If we forecast no growth, and plan to hold out stock indefinitely, we will then value the stock as a **PERPETUITY**.

<u>Constant Growth DDM</u> - A version of the dividend growth model in which dividends grow at a constant rate (Gordon Growth Model).

## **Example-** continued

If the same stock is selling for \$100 in the stock market, what might the market be assuming about the growth in dividends?

$$\$100 = \frac{\$3.00}{.12 - g}$$

#### <u>Answer</u>

The market is assuming the dividend will grow at 9% per year, indefinitely.

• If a firm elects to pay a lower dividend, and reinvest the funds, the stock price may increase because future dividends may be higher.

<u>Payout Ratio</u> - Fraction of earnings paid out as dividends

<u>Plowback Ratio</u> - Fraction of earnings retained by the firm.

Growth can be derived from applying the return on equity to the percentage of earnings plowed back into operations.

g = return on equity X plowback ratio

## Example

*Our company forecasts to pay a \$5.00* dividend next year, which represents 100% of its earnings. This will provide investors with a 12% expected return. Instead, we decide to plow back 40% of the earnings at the firm's current return on equity of 20%. What is the value of the stock before and after the plowback decision?

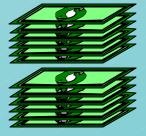

#### Example

Our company forecasts to pay a \$5.00 dividend next year, which represents 100% of its earnings. This will provide investors with a 12% expected return. Instead, we decide to blow back 40% of the earnings at the firm's current return on equity of 20%. What is the value of the stock before and after the plowback decision?

#### No Growth

$$P_0 = \frac{5}{.12} = \$41.67$$

#### Example

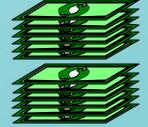

Our company forecasts to pay a \$5.00 dividend next year, which represents 100% of its earnings. This will provide investors with a 12% expected return. Instead, we decide to blow back 40% of the earnings at the firm's current return on equity of 20%. What is the value of the stock before and after the plowback decision?

#### No Growth

$$P_0 = \frac{5}{.12} = \$41.67$$

 $g = .20 \times .40 = .08$ 

 $P_0 = \frac{3}{12 - 08} = \$75.00$ 

#### Example - continued

If the company did not plowback some earnings, the stock price would remain at \$41.67. With the plowback, the price rose to \$75.00.

The difference between these two numbers (75.00-41.67=33.33) is called the Present Value of Growth Opportunities (PVGO).

Present Value of Growth Opportunities (PVGO)
- Net present value of a firm's future investments.

Sustainable Growth Rate - Steady rate at which a firm can grow: plowback ratio X return on equity.

- Free Cash Flows (FCF) should be the theoretical basis for all PV calculations.
- FCF is a more accurate measurement of PV than either Div or EPS.
- The market price does not always reflect the PV of FCF.
- When valuing a business for purchase, always use FCF.

## Valuing a Business

The value of a business is usually computed as the discounted value of FCF out to a *valuation horizon (H)*.

• The *valuation horizon* is sometimes called the terminal value and is calculated like *PVGO*.

$$PV = \frac{FCF_1}{(1+r)^1} + \frac{FCF_2}{(1+r)^2} + \dots + \frac{FCF_H}{(1+r)^H} + \frac{PV_H}{(1+r)^H}$$

Valuing a Business

$$PV = \frac{FCF_1}{(1+r)^1} + \frac{FCF_2}{(1+r)^2} + \dots + \frac{FCF_H}{(1+r)^H} + \frac{PV_H}{(1+r)^H}$$

PV (free cash flows)

PV (horizon value)

## <u>Example</u>

Given the cash flows for Concatenator Manufacturing Division, calculate the PV of near term cash flows, PV (horizon value), and the total value of the firm. r=10% and g=6%

	Year									
	1	2	3	4	5	6	7	8	9	10
AssetValue	10.00	12.00	14.40	17.28	20.74	23.43	26.47	28.05	29.73	31.51
Earnings	1.20	1.44	1.73	2.07	2.49	2.81	3.18	3.36	3.57	3.78
Investment	2.00	2.40	2.88	3.46	2.69	3.04	1.59	1.68	1.78	1.89
FreeCashFlow	80	96	-1.15	-1.39	20	23	1.59	1.68	1.79	1.89
.EPSgrowth(%)	20	20	20	20	20	13	13	6	6	6

#### **Example - continued**

Given the cash flows for Concatenator Manufacturing Division, calculate the PV of near term cash flows, PV (horizon value), and the total value of the firm. r=10% and g=6%

PV(horizon value) = 
$$\frac{1}{(1.1)^6} \left( \frac{1.59}{.10 - .06} \right) = 22.4$$

$$PV(FCF) = -\frac{.80}{1.1} - \frac{.96}{(1.1)^2} - \frac{1.15}{(1.1)^3} - \frac{1.39}{(1.1)^4} - \frac{.20}{(1.1)^5} - \frac{.23}{(1.1)^6}$$
$$= -3.6$$

#### **Example - continued**

Given the cash flows for Concatenator Manufacturing Division, calculate the PV of near term cash flows, PV (horizon value), and the total value of the firm. r=10% and g=6%

# PV(business) = PV(FCF) + PV(horizon value)= -3.6 + 22.4= \$18.8

## **Principles of Corporate Finance**

**Brealey and Myers** 

**Sixth Edition** 

 Why Net Present Value Leads to Better Investment Decisions than Other Criteria

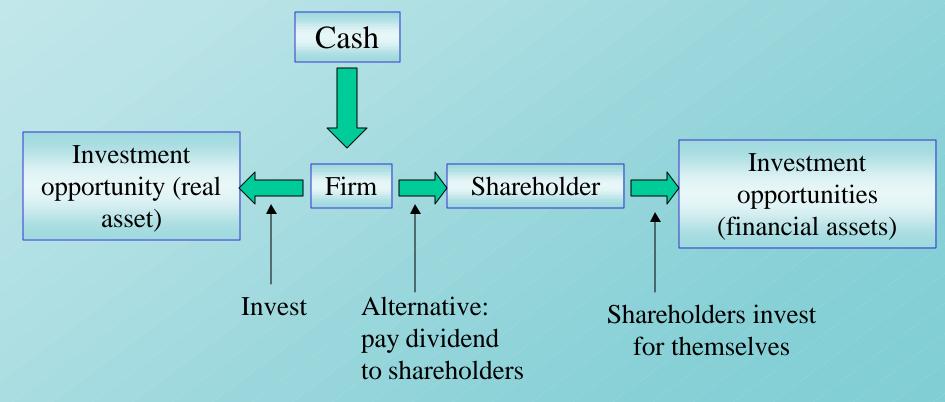

## **Chapter 5**

# **Topics Covered**

- NPV and its Competitors
- The Payback Period
- The Book Rate of Return
- Internal Rate of Return
- Capital Rationing

# **NPV and Cash Transfers**

• Every possible method for evaluating projects impacts the flow of cash about the company as follows.

# Payback

- The payback period of a project is the number of years it takes before the cumulative forecasted cash flow equals the initial outlay.
- The payback rule says only accept projects that "payback" in the desired time frame.
- This method is very flawed, primarily because it ignores later year cash flows and the the present value of future cash flows.

## <u>Example</u>

Examine the three projects and note the mistake we would make if we insisted on only taking projects with a payback period of 2 years or less.

Project	C <sub>0</sub>	<b>C</b> <sub>1</sub>	<b>C</b> <sub>2</sub>	<b>C</b> <sub>3</sub>	Payback Period	NPV@ 10%
A	- 2000	500	500	5000		
В	- 2000	500	1800	0		
C	- 2000	1800	500	0		

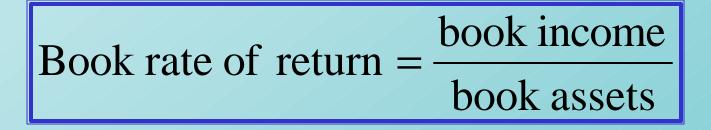

## <u>Example</u>

Examine the three projects and note the mistake we would make if we insisted on only taking projects with a payback period of 2 years or less.

Project	C <sub>0</sub>	<b>C</b> <sub>1</sub>	<b>C</b> <sub>2</sub>	<b>C</b> <sub>3</sub>	Payback Period	NPV@ 10%
A	- 2000	500	500	5000	/ 3/	+2,624
В	- 2000	500	1800	0	2	-58
C	- 2000	1800	500	0	2	+50

## **Book Rate of Return**

Book Rate of Return - Average income divided by average book value over project life. Also called *accounting rate of return*.

Managers rarely use this measurement to make decisions. The components reflect tax and accounting figures, not market values or cash flows.

## <u>Example</u>

You can purchase a turbo powered machine tool gadget for \$4,000. The investment will generate \$2,000 and \$4,000 in cash flows for two years, respectively. What is the IRR on this investment?

#### **Example**

You can purchase a turbo powered machine tool gadget for \$4,000. The investment will generate \$2,000 and \$4,000 in cash flows for two years, respectively. What is the IRR on this investment?

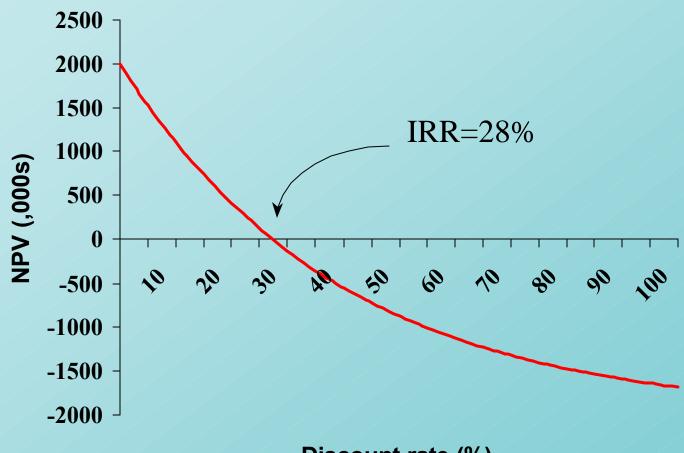

$$NPV = -4,000 + \frac{2,000}{(1 + IRR)^{1}} + \frac{4,000}{(1 + IRR)^{2}} = 0$$

#### **Example**

You can purchase a turbo powered machine tool gadget for \$4,000. The investment will generate \$2,000 and \$4,000 in cash flows for two years, respectively. What is the IRR on this investment?

$$NPV = -4,000 + \frac{2,000}{(1 + IRR)^{1}} + \frac{4,000}{(1 + IRR)^{2}} = 0$$

IRR = 28.08%

**Discount rate (%)** 

## Pitfall 1 - Lending or Borrowing?

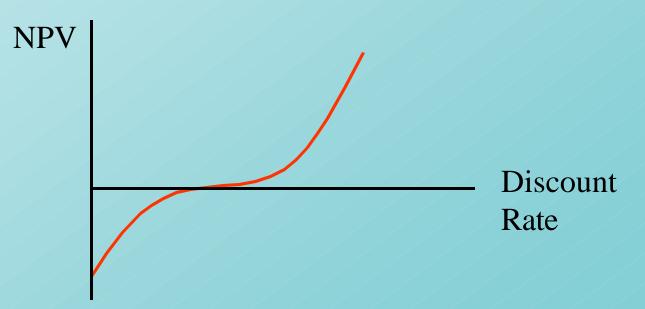

- With some cash flows (as noted below) the NPV of the project increases s the discount rate increases.
- This is contrary to the normal relationship between NPV and discount rates.

$$C_0$$
 $C_1$ 
 $C_2$ 
 $C_3$ 
 IRR
 NPV @ 10%

 +1,000
 -3,600
 -4,320
 -1,728
 + 20%
 -.75

#### Pitfall 1 - Lending or Borrowing?

- With some cash flows (as noted below) the NPV of the project increases s the discount rate increases.
- This is contrary to the normal relationship between NPV and discount rates.

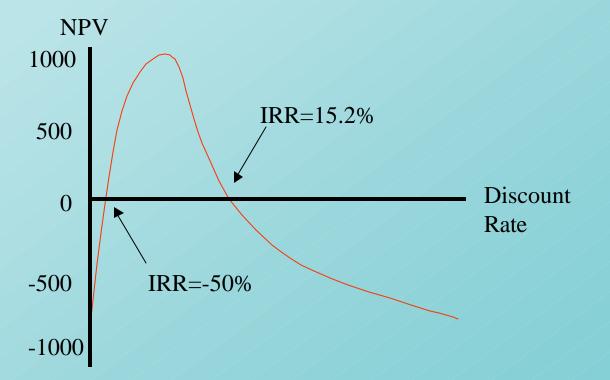

## Pitfall 2 - Multiple Rates of Return

- Certain cash flows can generate NPV=0 at two different discount rates.
- The following cash flow generates NPV=0 at both (-50%) and 15.2%.

#### Pitfall 2 - Multiple Rates of Return

- Certain cash flows can generate NPV=0 at two different discount rates.
- The following cash flow generates NPV=0 at both (-50%) and 15.2%.

## Pitfall 3 - Mutually Exclusive Projects

- IRR sometimes ignores the magnitude of the project.
- The following two projects illustrate that problem.

Project (	$C_0$		NPV @ 10%
E $-10$	),000 + 20,	000 100	+8.182
F $-20$	),000 + 35,	000 75	+11,818

## Pitfall 4 - Term Structure Assumption

- We assume that discount rates are stable during the term of the project.
- This assumption implies that all funds are reinvested at the IRR.
- This is a false assumption.

Calculating the IRR can be a laborious task. Fortunately, financial calculators can perform this function easily. Note the previous example.

#### **Internal Rate of Return**

Calculating the IRR can be a laborious task. Fortunately, financial calculators can perform this function easily. Note the previous example.

IRR

CPT

All produce IRR=12.96

- When resources are limited, the profitability index (PI) provides a tool for selecting among various project combinations and alternatives.
- A set of limited resources and projects can yield various combinations.
- The highest weighted average PI can indicate which projects to select.

Profitability Index = 
$$\frac{NPV}{Investment}$$

#### **Example**

We only have \$300,000 to invest. Which do we select?

<u>Proj</u>	<u>NPV</u>	Investment	<u>PI</u>
A	230,000	200,000	1.15
В	141,250	125,000	1.13
C	194,250	175,000	1.11
D	162,000	150,000	1.08

#### **Example - continued**

<u>Proj</u>	<u>NPV</u>	<u>Investment</u>	<u>PI</u>
А	230,000	200,000	1.15
В	141,250	125,000	1.13
C	194,250	175,000	1.11
D	162,000	150,000	1.08

Select projects with highest Weighted Avg PI WAPI (BD) =  $\frac{1.13(125) + 1.08(150) + 1.0(25)}{(300)}$ = 1.09

#### **Example - continued**

<u>Proj</u>	<u>NPV</u>	<u>Investment</u>	<u>PI</u>
А	230,000	200,000	1.15
В	141,250	125,000	1.13
С	194,250	175,000	1.11
D	162,000	150,000	1.08

Select projects with highest Weighted Avg PI WAPI (BD) = 1.09 WAPI (A) = 1.10 WAPI (BC) = 1.12

# **Linear Programming**

- Maximize Cash flows or NPV
- Minimize costs

#### <u>Example</u>

Max NPV = 21Xn + 16 Xb + 12 Xc + 13 Xd

subject to 10Xa + 5Xb + 5Xc + 0Xd <= 10 -30Xa - 5Xb - 5Xc + 40Xd <= 12

#### **Principles of Corporate Finance**

**Brealey and Myers** 

**Sixth Edition** 

#### Making Investment Decisions with the Net Present Value Rule

### **Chapter 6**

# **Topics Covered**

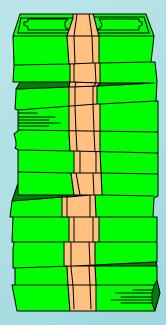

- What To Discount
- IM&C Project
- Project Interaction
  - → Timing
  - → Equivalent Annual Cost
  - → Replacement
  - → Cost of Excess Capacity
  - → Fluctuating Load Factors

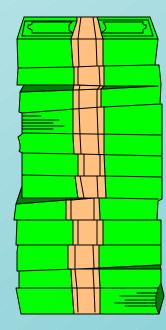

#### What To Discount

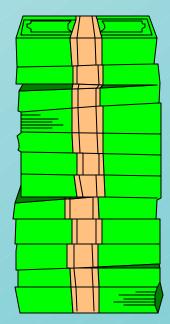

#### **Only Cash Flow is Relevant**

#### What To Discount

#### **Only Cash Flow is Relevant**

#### **Points to "Watch Out For"**

- Do not confuse average with incremental payoff.
- Include all incidental effects.
- Do not forget working capital requirements.
- ⇒Forget sunk costs.
- ➡Include opportunity costs.
- Beware of allocated overhead costs.

#### **INFLATION RULE**

- Be consistent in how you handle inflation!!
- Use nominal interest rates to discount nominal cash flows.
- Use real interest rates to discount real cash flows.
- You will get the same results, whether you use nominal or real figures.

#### <u>Example</u>

You own a lease that will cost you \$8,000 next year, increasing at 3% a year (the forecasted inflation rate) for 3 additional years (4 years total). If discount rates are 10% what is the present value cost of the lease?

#### <u>Example</u>

You own a lease that will cost you \$8,000 next year, increasing at 3% a year (the forecasted inflation rate) for 3 additional years (4 years total). If discount rates are 10% what is the present value cost of the lease?

 $1 + \text{real interest rate} = \frac{1 + \text{nominal interest rate}}{1 + \text{inflation rate}}$ 

#### <u>Example - nominal figures</u>

- Year Cash Flow
- 1 8000
- $2 \qquad 8000 \text{x} 1.03 = 8240$
- $3 \qquad 8000 \text{x} 1.03^2 = 8240 \\4 \qquad 8000 \text{x} 1.03^3 = 8487.20$

PV @ 10%
$\frac{8000}{1.10} = 7272.73$
$\frac{8240}{1.10^2} = 6809.92$
$\frac{8487.20}{1.10^3} = 6376.56$
$\frac{8741.82}{1.10^4} = 5970.78$
\$2642999

 $\Psi = O_{\gamma}$ 

#### **Example - real figures**

Year	Cash Flow	PV@6.7961%
1	$\frac{8000}{1.03} = 7766.99$	$\frac{7766.99}{1.068} = 7272.73$
2	$\frac{8240}{1.03^2} = 7766.99$	$\frac{7766.99}{1.068^2} = 6809.92$
3	$\frac{8487.20}{1.03^3} = 7766.99$	$\frac{7766.99}{1.068^3} = 6376.56$
4	$\frac{8741.82}{1.03^4} = 7766.99$	$\frac{7766.99}{1.068^4} = 5970.78$

- Even projects with positive NPV may be more valuable if deferred.
- The actual NPV is then the current value of some future value of the deferred project.

Current NPV = 
$$\frac{\text{Net future value as of date }t}{(1+r)^t}$$

#### <u>Example</u>

You may harvest a set of trees at anytime over the next 5 years. Given the FV of delaying the harvest, which harvest date maximizes current NPV?

			Harvest	Year		
	0	1	2		4	5
Net FV (\$1000s)	50	64.4	77.5	89.4	100	109.4
% change in value		28.8	20.3	15.4	11.9	9.4

#### <u>Example - continued</u>

You may harvest a set of trees at anytime over the next 5 years. Given the FV of delaying the harvest, which harvest date maximizes current NPV?

*NPV* if harvested in year 
$$1 = \frac{64.4}{1.10} = 58.5$$

#### <u>Example - continued</u>

You may harvest a set of trees at anytime over the next 5 years. Given the FV of delaying the harvest, which harvest date maximizes current NPV?

*NPV* if harvested in year 
$$1 = \frac{64.4}{1.10} = 58.5$$

			Harvest	Year		
	~		2	3	4	5
NPV (\$1000s)	50	58.5	64.0	67.2	68.3	67.9

Equivalent Annual Cost - The cost per period with the same present value as the cost of buying and operating a machine. Equivalent Annual Cost - The cost per period with the same present value as the cost of buying and operating a machine.

Equivalent annual  $cost = \frac{present value of costs}{annuity factor}$ 

### **Equivalent Annual Cost**

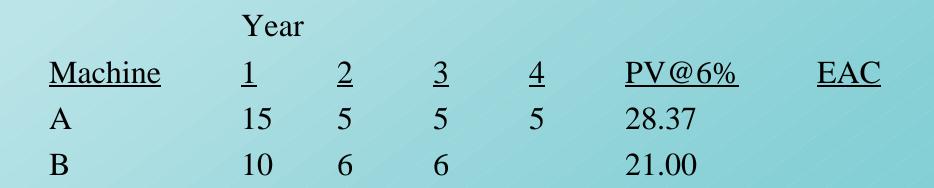

#### Example

Given the following costs of operating two machines and a 6% cost of capital, select the lower cost machine using equivalent annual cost method.

### **Equivalent Annual Cost**

#### Example

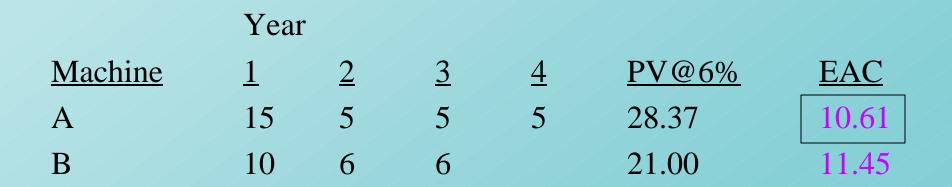

Given the following costs of operating two machines and a 6% cost of capital, select the lower cost machine using equivalent annual cost method.

### **Equivalent Annual Cost**

#### Example

Given the following costs of operating two machines and a 6% cost of capital, select the lower cost machine using equivalent annual cost method.

#### **Machinery Replacement**

Annual operating cost of old machine = 8

Cost of new machineYear: $\underline{0}$  $\underline{1}$  $\underline{2}$  $\underline{3}$ NPV @ 10%1555527.4

Equivalent annual cost of new machine = 27.4/(3-year annuity factor) = 27.4/2.5 = 11

MORAL: Do not replace until operating cost of old machine exceeds 11. A project uses existing warehouse and requires a new one to be built in Year 5 rather than Year 10. A warehouse costs 100 & lasts 20 years.

Equivalent annual cost @ 10% = 100/8.5 = 11.7

	<u>0</u> .	<u>5</u>	<u>6</u>	. <u>10</u>	<u>11</u>
With project	0	0	11.7	11.7	11.7
Without project	<u>0</u>	<u>0</u>	_0_	<u>0</u>	<u>11.7</u>
Difference	0	0	11.7	11.7	0

PV extra cost  $= \frac{11.7}{(1.1)^6} + \frac{11.7}{(1.1)^7} + \dots + \frac{11.7}{(1.1)^{10}} = 27.6$ 

## **Fluctuating Load Factors**

	Two Old Machines
Annual output per machine	750 units
Operating cost per machine	$2 \times 750 = \$1,500$
PV operating cost per pachine	1,500/.10=\$15,000
PV operating cost of two machines	$2 \times 15,000 = \$30,000$

### **Fluctuating Load Factors**

**Two New Machines** 

Annual output per machine750 unitsCapital cost pe machine\$6,000Operating cost per machine $1 \times 750 = \$750$ PV operating cost per pachine6,000 + 750/.10 = \$13,500PV operating cost of two machines $2 \times 13,500 = \$27,000$ 

### **Fluctuating Load Factors**

	One Old Machine	One New Machine
Annual output per machine	500 units	1,000 units
Capital cost pe machine	0	\$6,000
Operating cost per machine	$2 \times 500 = $1,000$	$1 \times 1,000 = $ \$1,000
PV operating cost per pachine	1,000/.10 = \$10,000	6,000 + 1,000 / .10 = \$16,000
PV operating cost of two machines	\$26,000

Deviation from Mean	Squared Deviation
+ 30	900
0	0
0	0
- 30	900
	Deviation from Mean + 30 0 0

Standard deviation = square of root variance =  $\sqrt{450}$  = 21.2%

#### Histogram of Annual Stock Market Returns

# of Years

**Diversification** - Strategy designed to reduce risk by spreading the portfolio across many investments.

- <u>Unique Risk</u> Risk factors affecting only that firm. Also called "diversifiable risk."
- <u>Market Risk</u> Economy-wide sources of risk that affect the overall stock market. Also called "systematic risk."

Χ

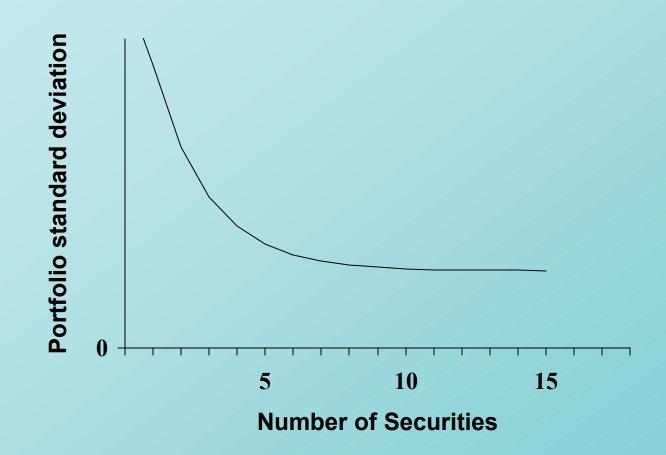

Portfolio rate of return

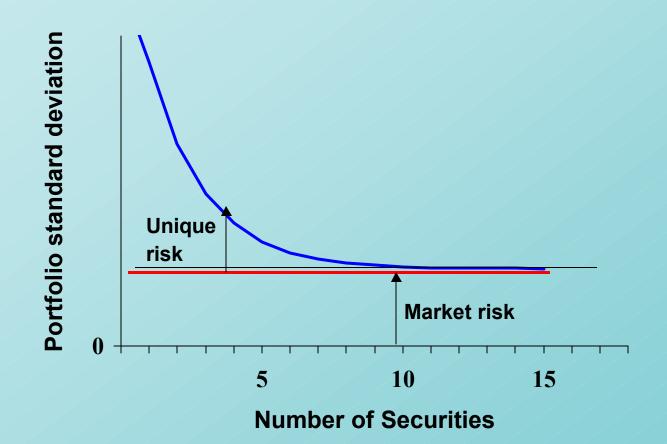

fraction of portfolio in first asset

fraction of portfolio in second asset

rate of return on first asset

rate of return on second asset

The variance of a two stock portfolio is the sum of these four boxes:

	Stock 1	Stock 2
Stock 1	$X_1^2 \acute{O}_1^2$	$ \begin{array}{c} x_{1} x_{2} \circ_{12} = \\ x_{1} x_{2} \tilde{n}_{12} \circ_{10} \circ_{2} \end{array} $
Stock 2	$ \begin{array}{c} x_{1} x_{2} \circ_{12} = \\ x_{1} x_{2} \tilde{n}_{12} \circ_{10} \circ_{2} \end{array} $	$X_2^2 \acute{O}_2^2$

#### Example

Suppose you invest \$55 in Bristol-Myers and \$45 in McDonald's. The expected dollar return on your BM is  $.10 \times 55 = 5.50$  and on McDonald's it is  $.20 \times 45 = 9.90$ . The expected dollar return on your portfolio is 5.50 + 9300 = 14.50. The portfolio rate of return is 14.50/100 = .145 or 14.5%. Assume a correlation coefficient of 1.

#### Example

Suppose you invest \$55 in Bristol-Myers and \$45 in McDonald's. The expected dollar return on your BM is  $.10 \times 55 = 5.50$  and on McDonald's it is  $.20 \times 45 = 9.90$ . The expected dollar return on your portfolio is 5.50 + 9300 = 14.50. The portfolio rate of return is 14.50/100 = .145 or 14.5%. Assume a correlation coefficient of 1.

	Bristol - Myers	McDonald' s
Bristol - Myers	$x_1^2 \circ x_1^2 = (.55)^2 \times (17.1)^2$	$x_1 x_2 \tilde{n}_{12} \phi_1 \phi_2 = .55 \times .45$
	$x_1 o_1 = (,,,,,,, .$	$\times 1 \times 17.1 \times 20.8$
McDonald' s	$x_1 x_2 \tilde{n}_{12} \circ_1 \circ_2 = .55 \times .45$	$x_{2}^{2} \circ x_{2}^{2} = (.45)^{2} \times (20.8)^{2}$
	$\times 1 \times 17.1 \times 20.8$	$X_2 O_2 = (.43) \times (20.8)$

#### Example

Suppose you invest \$55 in Bristol-Myers and \$45 in McDonald's. The expected dollar return on your BM is  $.10 \times 55 = 5.50$  and on McDonald's it is  $.20 \times 45 = 9.90$ . The expected dollar return on your portfolio is 5.50 + 9300 = 14.50. The portfolio rate of return is 14.50/100 = .145 or 14.5%. Assume a correlation coefficient of 1.

Portfolio Valriance =  $[(.55)^2 x (17.1)^2]$ +  $[(.45)^2 x (20.8)^2]$ + 2(.55x.45x1x17.1x20.8) = 352.10

Standard Deviation =  $\sqrt{352.1}$  = 18.7 %

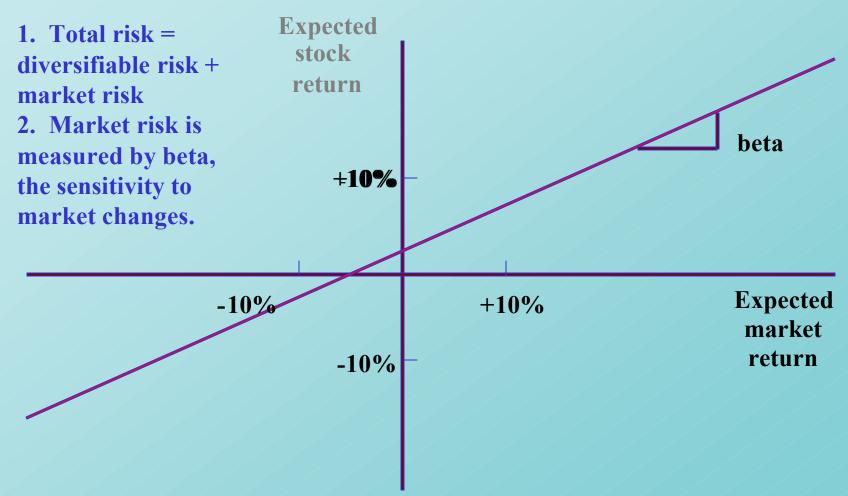

Expected Portfolio Return = 
$$(x_1r_1) + (x_2r_2)$$

#### Portfolio Variance = $x_1^2 \acute{0}_1^2 + x_2^2 \acute{0}_2^2 + 2(x_1 x_2 \tilde{n}_{12} \acute{0}_1 \acute{0}_2)$

The shaded boxes contain variance terms; the remainder contain covariance terms.

#### Capital Budgeting and Risk

## **Chapter 9**

## **Topics Covered**

- Measuring Betas
- Capital Structure and COC
- Discount Rates for Intl. Projects
- Estimating Discount Rates
- Risk and DCF

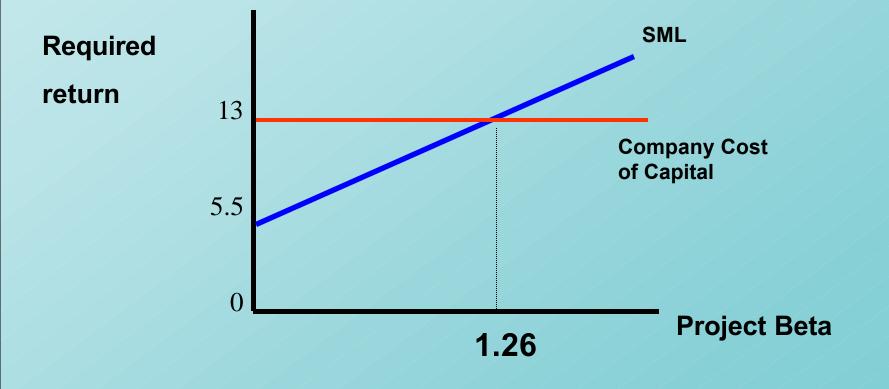

## **Company Cost of Capital**

 A firm's value can be stated as the sum of the value of its various assets.

#### Firm value = PV(AB) = PV(A) + PV(B)

## **Company Cost of Capital**

 A company's cost of capital can be compared to the CAPM required return.

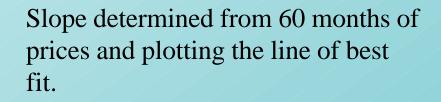

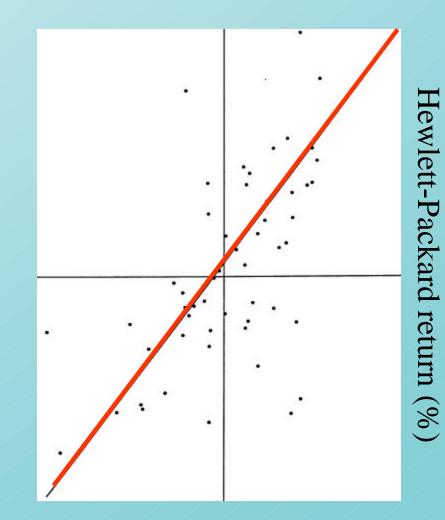

- The SML shows the relationship between return and risk.
- CAPM uses Beta as a proxy for risk.
- Beta is the slope of the SML, using CAPM terminology.
- Other methods can be employed to determine the slope of the SML and thus Beta.
- Regression analysis can be used to find Beta.

#### Hewlett Packard Beta

Price data - Jan 78 - Dec 82

 $R^2 = .53$ B = 1.35

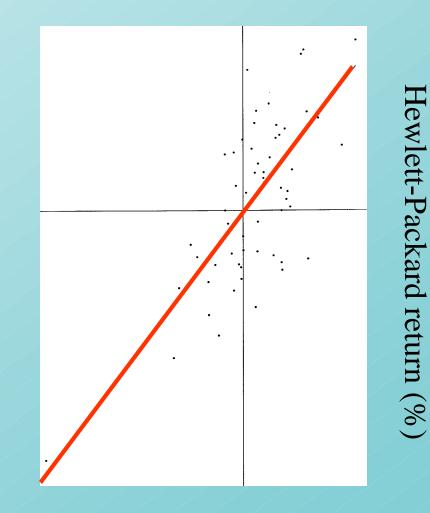

#### Hewlett Packard Beta

Price data - Jan 83 - Dec 87

 $R^2 = .49$ B = 1.33

Slope determined from 60 months of prices and plotting the line of best fit.

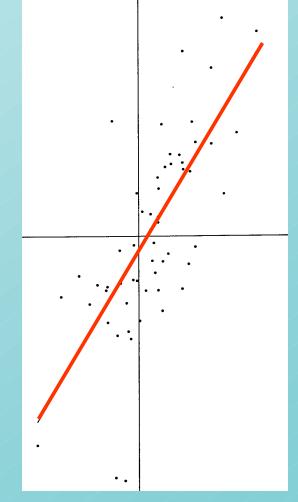

Hewlett Packard Beta

Price data - Jan 88 - Dec 92

## **Capital Budgeting & Risk**

Modify CAPM (account for proper risk)

- Use COC unique to project, rather than Company COC
- Take into account Capital Structure

#### **Company Cost of Capital** simple approach

 Company Cost of Capital (COC) is based on the average beta of the assets.

 The average Beta of the assets is based on the % of funds in each asset.

#### **Company Cost of Capital** simple approach

Company Cost of Capital (COC) is based on the average beta of the assets.

The average Beta of the assets is based on the % of funds in each asset.

Example 1/3 New Ventures B=2.0 1/3 Expand existing business B=1.3 1/3 Plant efficiency B=0.6

AVG B of assets = 1.3

Capital Structure - the mix of debt & equity within a company

Expand CAPM to include CS

becomes

$$R = r_f + B (r_m - r_f)$$
$$R_{equity} = r_f + B (r_m - r_f)$$

$$COC = r_{portfolio} = r_{assets}$$

 $COC = r_{portfolio} = r_{assets}$ 

$$r_{assets} = WACC = r_{debt} (D) + r_{equity} (E)$$
  
(V) (V)

 $COC = r_{portfolio} = r_{assets}$ 

$$r_{assets} = WACC = r_{debt} (D) + r_{equity} (E)$$
(V) (V)

$$B_{assets} = B_{debt} \frac{(D)}{(V)} + B_{equity} \frac{(E)}{(V)}$$

 $COC = r_{portfolio} = r_{assets}$ 

$$r_{assets} = WACC = r_{debt} (D) + r_{equity} (E)$$
(V) (V)

$$B_{assets} = B_{debt} (D) + B_{equity} (E)$$
(V)
(V)
$$r_{equity} = r_f + B_{equity} (r_m - r_f)$$

 $COC = r_{portfolio} = r_{assets}$ 

$$r_{assets} = WACC = r_{debt} (D) + r_{equity} (E)$$
  
(V) (V)

$$B_{assets} = B_{debt} (D) + B_{equity} (E)$$

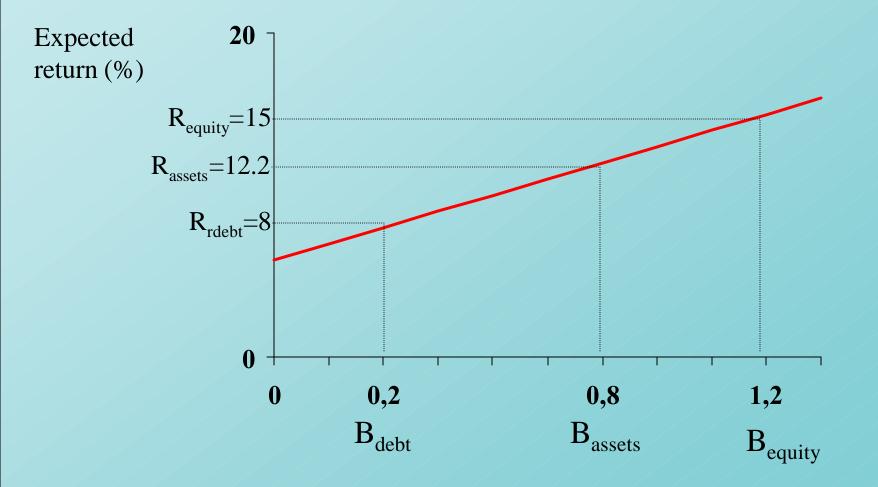

$$(V) (V)$$

$$r_{equity} = r_f + B_{equity} (r_m - r_f)$$

IMPORTANT

E, D, and V are all market values

Expected Returns and Betas prior to refinancing

#### Pinnacle West Corp.

$$R_{equity} = r_f + B (r_m - r_f)$$
  
= .045 + .51(.08) = .0858 or 8.6%

 $R_{debt} = YTM \text{ on bonds}$ = 6.9 %

## Pinnacle West Corp.

	Beta	Standard. Error
Boston Electric	.60	.19
Central HUdson	.30	.18
Consolidated Edison	.65	.20
DTE Energy	.56	.17
Eastern Utilities Assoc	.66	.19
GPU Inc	.65	.18

PECO Energy	.70	.23
Pinnacle West Corp	.43	.21
PP & LResources	.37	.21
Portfolio Average	.51	.15

#### Pinnacle West Corp.

$$COC = r_{assets} = \frac{D}{V}r_{debt} + \frac{E}{V}r_{equity}$$

= .35(.08) + .65(.10)

#### = .093 or 9.3%

#### **International Risk**

	<b>s</b> Ratio	Correlation coefficient	Beta
Argentina	3.52	.416	1.46
Brazil	3.80	.160	.62
Kazakhstan	2.36	.147	.35
Taiwan	3.80	.120	.47

Source: The Brattle Group, Inc.

*s Ratio* - Ratio of standard deviations, country index vs. S&P composite index

 Given three outcomes and their related probabilities and cash flows we can determine an unbiased forecast of cash flows.

Possible	Drobability	Prob weighted	Unbiased
cash flow	Probability	cash flow	forecast
1.2	.25	.3	
1.0	.50	.5	\$1.0 million
0.8	.25	.2	

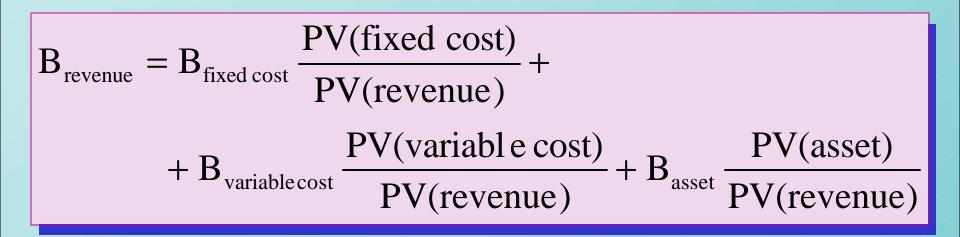

#### **Asset Betas**

Cash flow = revenue - fixed cost - variable cost

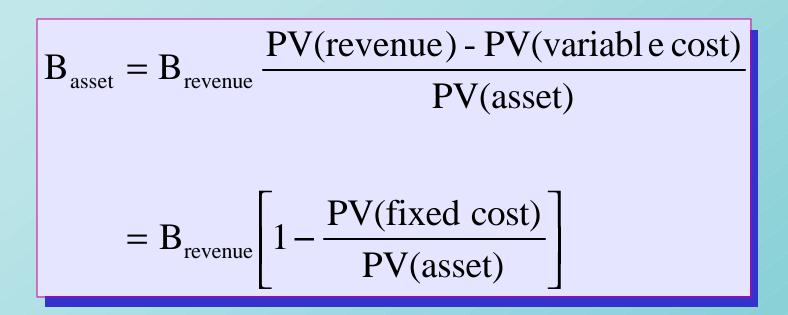

PV(asset) = PV(revenue) - PV(fixed cost) - PV(variable cost) or

PV(revenue) = PV(fixed cost) + PV(variable cost) + PV(asset)

#### **Asset Betas**

#### **Asset Betas**

#### Example

Project A is expected to produce CF = \$100 mil for each of three years. Given a risk free rate of 6%, a market premium of 8%, and beta of .75, what is the PV of the project?

#### Example

Project A is expected to produce CF = \$100 mil for each of three years. Given a risk free rate of 6%, a market premium of 8%, and beta of .75, what is the PV of the project?

$$r = r_f + B(r_m - r_f)$$
  
= 6 + .75(8)  
= 12%

#### Example

Project A is expected to produce CF = \$100 mil for each of three years. Given a risk free rate of 6%, a market premium of 8%, and beta of .75, what is the PV of the project?

	Project A	
Year	Cash Flow	PV @ 12%
1	100	89.3
2	100	79.7
3	100	71.2
	Total PV	240.2

$$r = r_f + B(r_m - r_f) = 6 + .75(8) = 12\%$$

#### Example

Project A is expected to produce CF = \$100 mil for each of three years. Given a risk free rate of 6%, a market premium of 8%, and beta of .75, what is the PV of the project?

	Project A	
Year	Cash Flow	PV @ 12%
1	100	89.3
2	100	79.7
3	100	71.2
	Total PV	240.2

$$r = r_f + B(r_m - r_f)$$
  
= 6 + .75(8)  
= 12%

Now assume that the cash flows change, but are RISK FREE. What is the new PV?

#### Example

Project A is expected to produce CF = \$100 mil for each of three years. Given a risk free rate of 6%, a market premium of 8%, and beta of .75, what is the PV of the project?.. Now assume that the cash flows change, but are RISK FREE. What is the new PV?

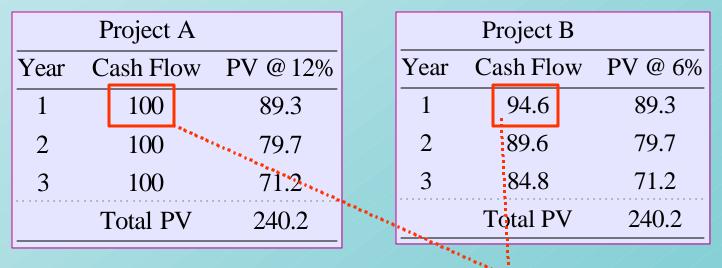

#### Project B

	Project A		Y
Year	Cash Flow	PV @ 12%	
1	100	89.3	
2	100	79.7	
3	100	71.2	
	Total PV	240.2	•••

Year	Cash Flow	PV @ 6%
1	94.6	89.3
2	89.6	79.7
3	84.8	71.2
	Total PV	240.2

#### Example

Project A is expected to produce CF = \$100 mil for each of three years. Given a risk free rate of 6%, a market premium of 8%, and beta of .75, what is the PV of the project?.. Now assume that the cash flows change, but are RISK FREE. What is the new PV?

Since the 94.6 is risk free, we call it a *Certainty Equivalent* of the 100.

# **Risk, DCF and CEQ**

#### Example

Project A is expected to produce CF = \$100 mil for each of three years. Given a risk free rate of 6%, a market premium of 8%, and beta of .75, what is the PV of the project?.. Now assume that the cash flows change, but are RISK FREE. What is the new PV?

The difference between the 100 and the certainty equivalent (94.6) is 5.4%...this % can be considered the annual premium on a risky cash flow

 $\frac{\text{Risky cash flow}}{1.054} = \text{certainty equivalent cash flow}$ 

# **Risk, DCF and CEQ**

#### Example

Project A is expected to produce CF = \$100 mil for each of three years. Given a risk free rate of 6%, a market premium of 8%, and beta of .75, what is the PV of the project?.. Now assume that the cash flows change, but are RISK FREE. What is the new PV?

Year 
$$1 = \frac{100}{1.054} = 94.6$$
  
Year  $2 = \frac{100}{1.054^2} = 89.6$   
Year  $3 = \frac{100}{1.054^3} = 84.8$ 

• The prior example leads to a generic certainty equivalent formula.

$$PV = \frac{C_t}{(1+r)^t} = \frac{CEQ_t}{(1+r_f)^t}$$

**Brealey and Myers** 

**Sixth Edition** 

### ♦ A Project Is Not a Black Box

## **Chapter 10**

# **Topics Covered**

- Sensitivity Analysis
- Break Even Analysis
- Monte Carlo Simulation
- Decision Trees

Sensitivity Analysis - Analysis of the effects of changes in sales, costs, etc. on a project. Scenario Analysis - Project analysis given a particular combination of assumptions. Simulation Analysis - Estimation of the probabilities of different possible outcomes. Break Even Analysis - Analysis of the level of sales (or other variable) at which the company breaks even.

### Example

Given the expected cash flow forecasts for Otoban Company's Motor Scooter project, listed on the next slide, determine the NPV of the project given changes in the cash flow components using a 10% cost of capital. Assume that all variables remain constant, except the one you are changing.

#### Example - continued

	Year 0	Years 1-10
Investment	-15	
Sales		37.5
Variable Costs		30
Fixed Costs		3
Depreciation		1.5
Pretax profit		3
.Taxes @ 50%		1.5
Profit after tax		1.5
Operating cash flow		3.0
Net Cash Flow	-15	3

¥

#### NPV= 3.43 billion Yen

#### Example - continued

#### **Possible Outcomes**

#### Example - continued

NPV Calculations for Pessimistic Market Size Scenario

	Year 0	Years 1 - 10
Investment	-15	
Sales		41.25
Variable Costs		33
Fixed Costs		3
Depreciation		1.5
Pretax profit		3.75
.Taxes @ 50%		1.88
Profit after tax		1.88
Operating cash flow		3.38
Net Cash Flow	-15	+ 3.38

<u>NPV= +5.7 bil ven</u>

¥

#### Example - continued

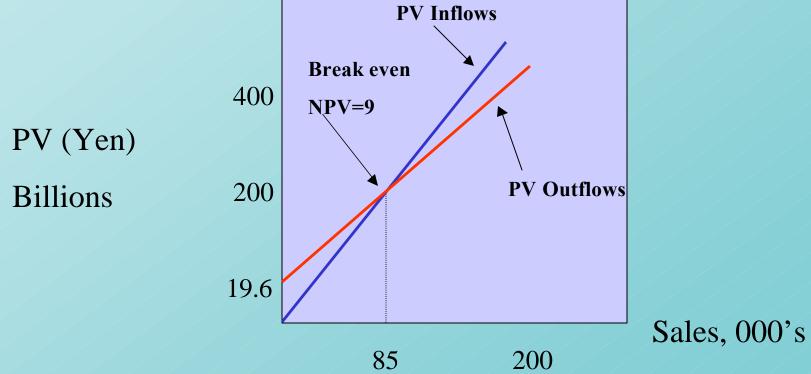

### NPV Possibilities (Billions Yen)

	Range			
Variable	Pessimistic	Expected	Optimistic	
Market Size	1.1	3.4	5.7	
Market Share	- 10.4	3.4	17.3	
Unit price	- 4.2	3.4	5.0	
Unit Var Cost	- 15.0	3.4	11.1	
Fixed Cost	0.4	3.4	6.5	

# **Break Even Analysis**

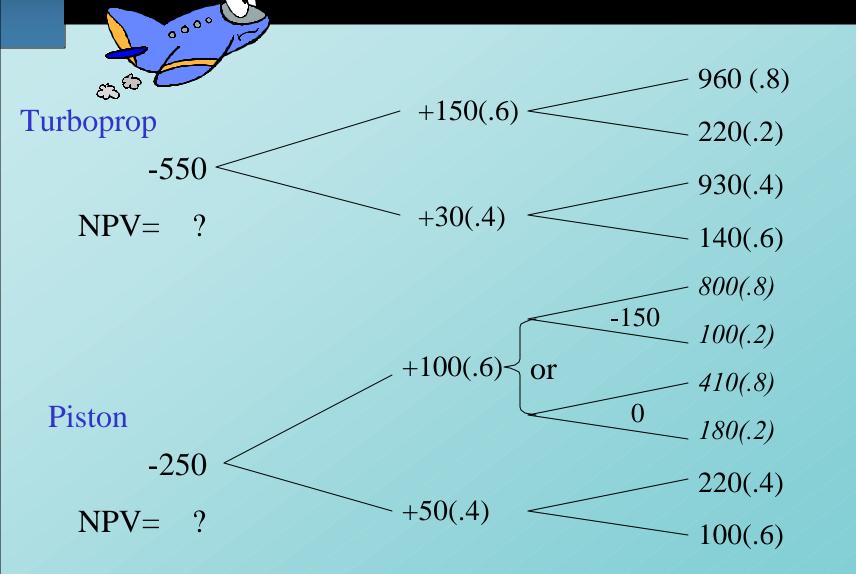

- Point at which the NPV=0 is the break even point.
- Otoban Motors has a breakeven point of 8,000 units sold.

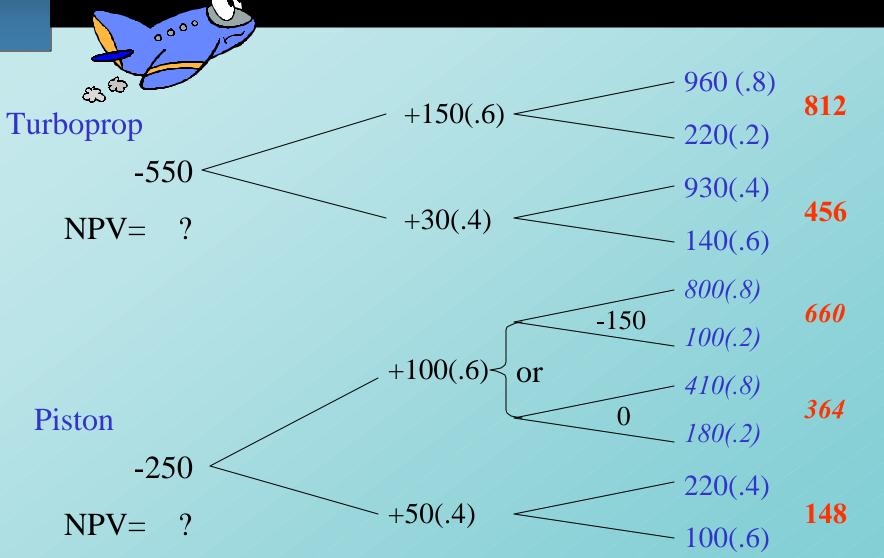

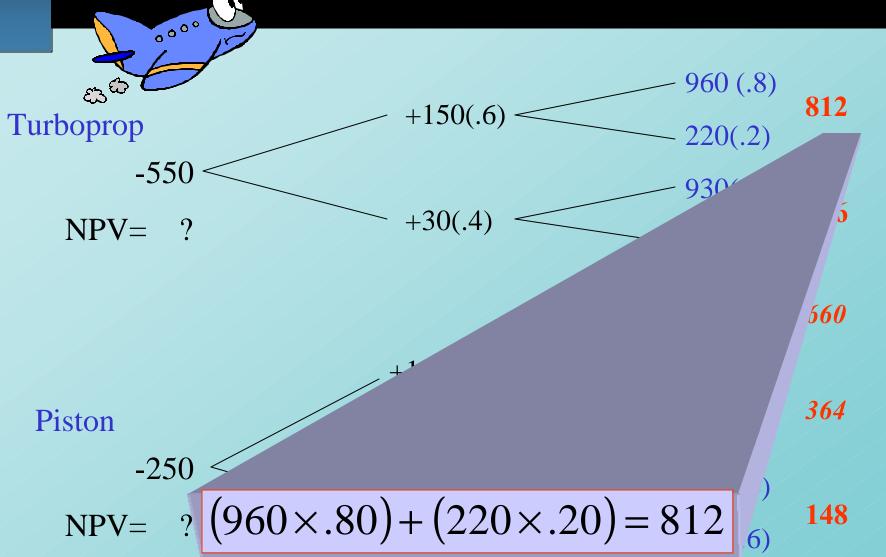

## **Monte Carlo Simulation**

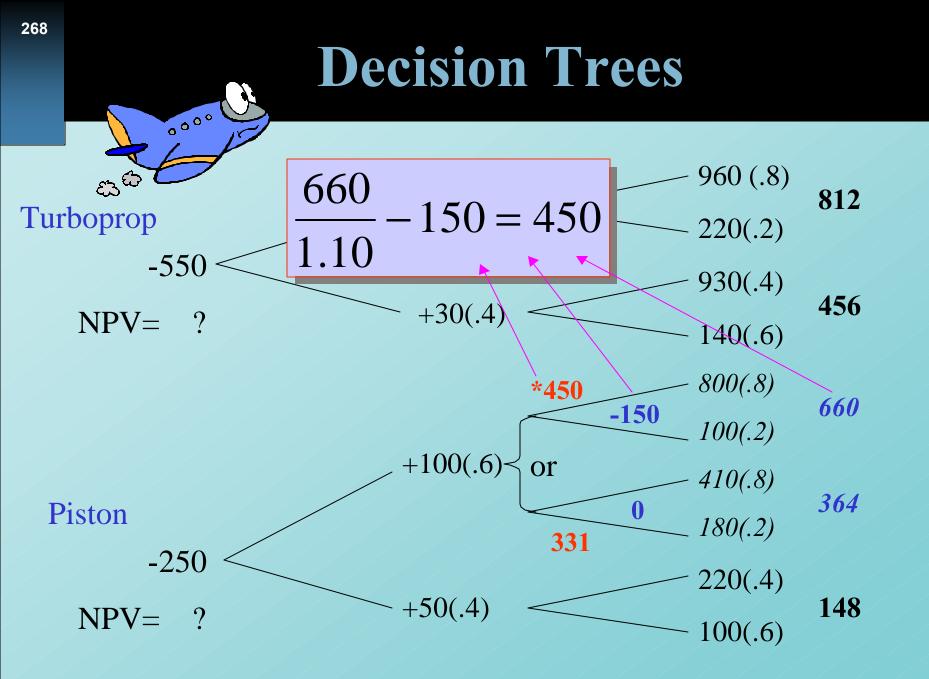

### **Modeling Process**

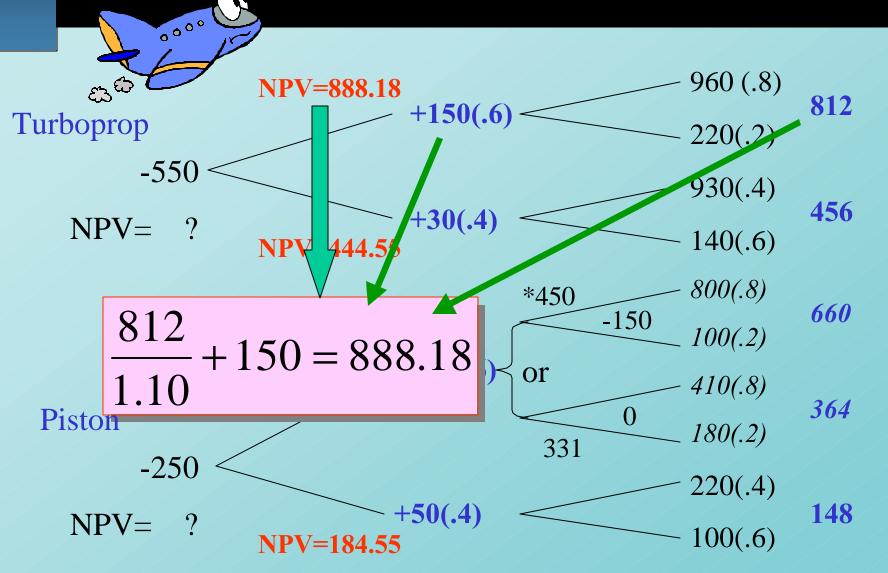

- Step 1: Modeling the Project
- Step 2: Specifying Probabilities
- Step 3: Simulate the Cash Flows

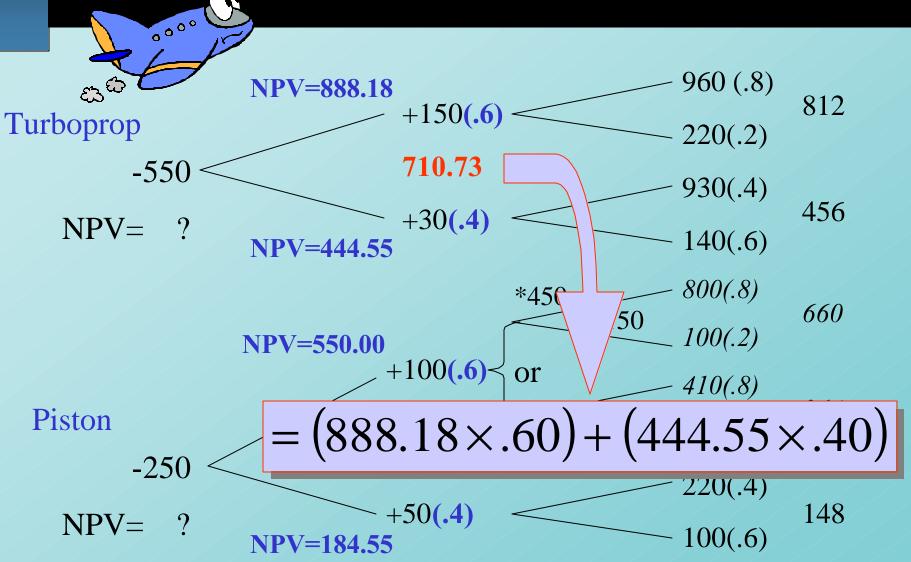

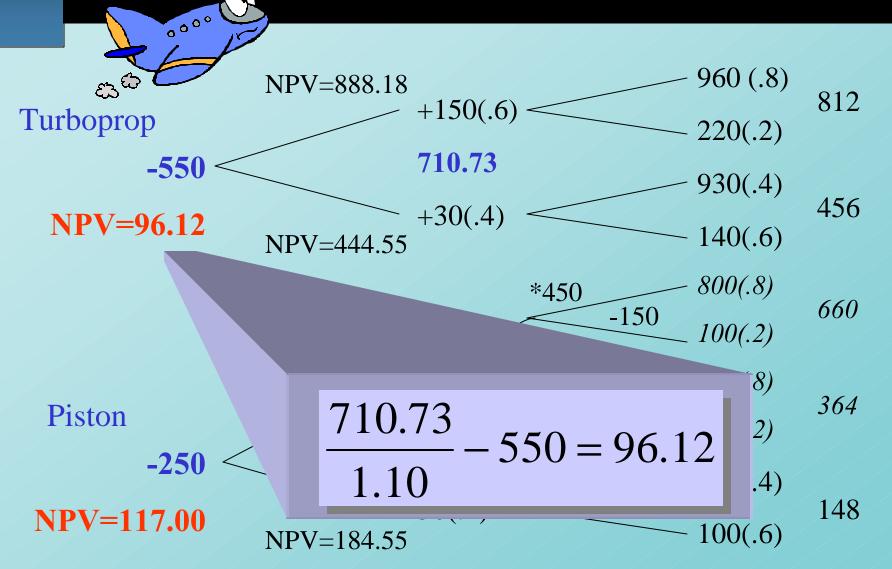

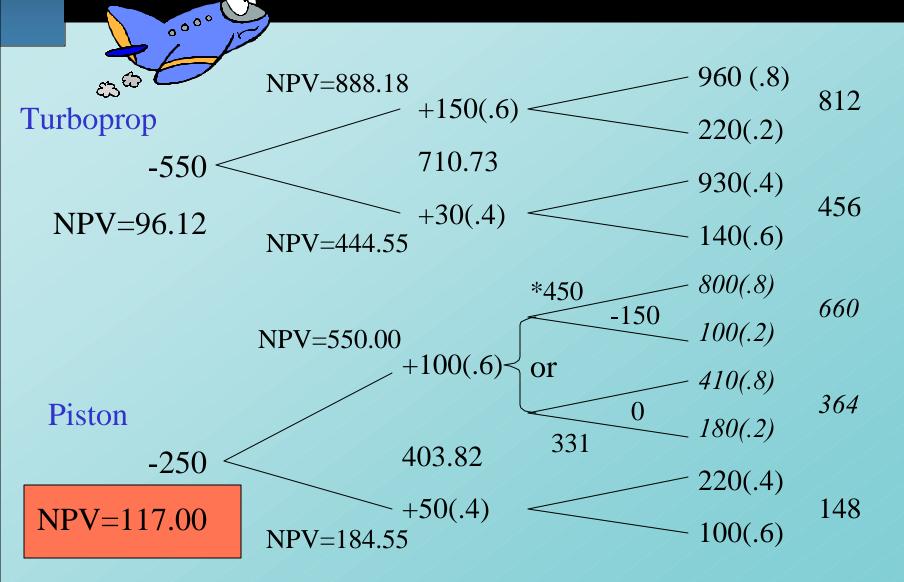

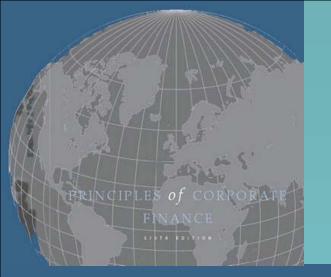

#### **Principles of Corporate Finance**

**Brealey and Myers** 

**Sixth Edition** 

Where Net Present Values
 Come From

### **Chapter 11**

# **Topics Covered**

- Look First To Market Values
- Forecasting Economic Rents
- Marvin Enterprises

## **Market Values**

 Smart investment decisions make MORE money than smart financing decisions

## **Market Values**

- Smart investments are worth more than they cost: they have positive NPVs
- Firms calculate project NPVs by discounting forecast cash flows, but . . .

 Projects may *appear* to have positive NPVs because of forecasting errors.

e.g. some acquisitions result from errors in a DCF analysis.

## **Market Values**

Positive NPVs stem from a comparative advantage.

 Strategic decision-making identifies this comparative advantage; it does *not* identify growth areas. • *Don't* make investment decisions on the basis of errors in your DCF analysis.

 Start with the market price of the asset and ask whether it is worth more to you than to others. • *Don't* assume that other firms will watch passively.

Ask --How long a lead do I have over my rivals? What will happen to prices when that lead disappears?

In the meantime how will rivals react to my move? Will they cut prices or imitate my product?

### **Department Store Rents**

NPV = 
$$-100 + \frac{8}{1.10} + \dots + \frac{8 + 134}{1.10^{10}} = $1 million$$

[assumes price of property appreciates by 3% a year]

Rental yield = 
$$10 - 3 = 7\%$$

NPV 
$$\frac{8-7}{1.10} + \frac{8-7.21}{1.10^2} + \ldots + \frac{8-8.87}{1.10^9} + \frac{8-9.13}{1.10^{10}} = \$1$$
 million

# **Using Market Values**

#### **EXAMPLE: KING SOLOMON'S MINE**

- Investment = \$200 million
- Life = 10 years
- **Production** = .1 million oz. a year
- **Production cost** = \$200 per oz.
- **Current gold price** = \$400 per oz.
- **Discount rate** = 10%

# **Using Market Values**

#### **EXAMPLE: KING SOLOMON'S MINE - continued**

If the gold price is forecasted to rise by 5% p.a.: NPV = -200 + (.1(420 - 200))/1.10 + (.1(441 - 200))/1.10<sup>2</sup> + ... = - \$10 m. But if gold is fairly priced, you do not need to forecast future gold prices: NPV = -investment + PV revenues - PV costs

 $= 200 + 400 - S ((.1 \times 200)/1.10^{t}) = $77 million$ 

# **Do Projects Have Positive NPVs?**

- Rents = profits that more than cover the cost of capital.
- NPV = PV (rents)
- Rents come only when you have a better product, lower costs or some other competitive edge.
- Sooner or later competition is likely to eliminate rents.

Proposal to manufacture specialty chemicals

- Raw materials were commodity chemicals imported from Europe.
- Finished product was exported to Europe.
- High early profits, but . . .
- . . . what happens when competitors enter?

**Marvin Enterprises** 

<u>Technology</u>	<b>Capacity</b>		<u>Unit cost</u>		
	<u>Industry</u>	<u>Marvin</u>	<u>Capital</u>	Prodn.	Salvage value

### Making Sure Managers Maximize NPV

# **Chapter 12**

# **Topics Covered**

- The capital investment process
- Decision Makers and Information
- Incentives
- Residual Income and EVA
- Accounting Performance Measures
- Economic Profit

# **The Principal Agent Problem**

#### Shareholders = Owners

# *Question:* Who has the power?

#### Answer: Managers

#### Managers = Employees

### **Capital Investment Decision**

Strategic Planning "Top Down"

**Capital Investments** 

Project Creation "Bottom Up"

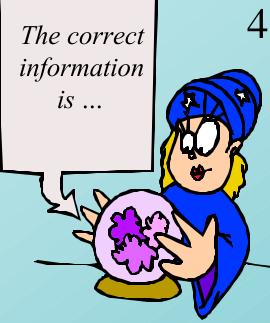

# **Off Budget Expenditures**

Information Technology
Research and Development
Marketing
Training and Development

### **Information Problems**

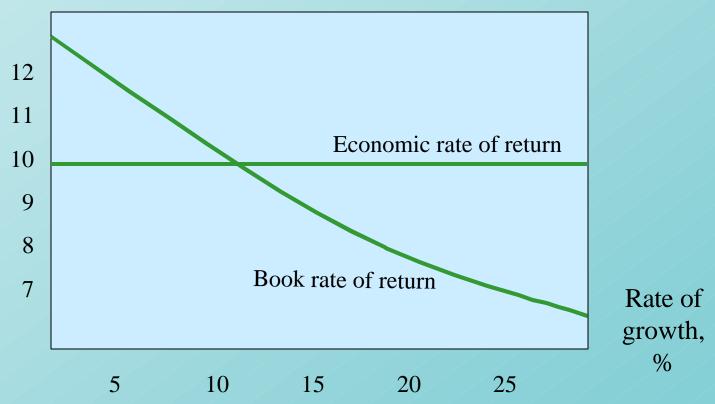

- 1. Consistent Forecasts
- 2. Reducing Forecast Bias
- 3. Getting Senior Management Needed Information

4. Eliminating Conflicts of Interest

### **Growth and Returns**

Rate of return, %

# Brealey & Myers Second Law

The proportion of proposed projects having a positive NPV at the official corporate hurdle rate is independent of the hurdle rate.

### Incentives

### **Agency Problems in Capital Budgeting**

- Reduced effort
- Perks
- Empire building
- Entrenching investment
- Avoiding risk

### **Incentive Issues**

- Monitoring Reviewing the actions of managers and providing incentives to maximize shareholder value.
- Free Rider Problem When owners rely on the efforts of others to monitor the company.
- Compensation How to pay managers so as to reduce the cost and need for monitoring and to maximize shareholder value.

- Techniques for overcoming errors in accounting measurements of performance.
- Emphasizes NPV concepts in performance evaluation over accounting standards.
- Looks more to long term than short term decisions.
- More closely tracks shareholder value than accounting measurements.

#### **Quayle City Subduction Plant (\$mil)**

<u>Income</u>		Assets			
Sales	550	Net W.C.	80		
COGS	275	Property, plant and			
Selling, G&A	75	equipment	1170		
	200	less depr.	<u>360</u>		
taxes @ 35%	_70	Net Invest	810		
Net Income	\$130	Other assets	<u>110</u>		
		Total Assets	\$1,000		

303

#### **Quayle City Subduction Plant (\$mil)**

$$ROI = \frac{130}{1,000} = .13$$

#### Given COC = 10%

### NetROI = 13% - 10% = 3%

*Residual Income or EVA* = Net Dollar return after deducting the cost of capital.

EVA = \_\_idual Income = Income Earned - income required = Income Earned - [Cost of Capital × Investment]

© EVA is copyrighted by Stern-Stewart Consulting Firm and used with permission.

**Quayle City Subduction Plant (\$mil)** 

Given COC = 12%

EV = sidual Income $= 130 - (.12 \times 1,000)$ = +\$10 million

### **Economic Profit**

*Economic Profit* = capital invested multiplied by the spread between return on investment and the cost of capital.

$$EP = \text{onomic Profit}$$
$$= (ROI - r) \times \text{Capital Invested}$$

© EVA is copyrighted by Stern-Stewart Consulting Firm and used with permission.

### **Economic Profit**

**<u>Ouayle City Subduction Plant (\$mil)</u>** 

Example at 12% COC continued.

$$EP = (ROI - r \times \text{oital Invested})$$
$$= (.13 - .12) \times 1,000$$
$$= \$10 \text{million}$$

© EVA is copyrighted by Stern-Stewart Consulting Firm and used with permission.

- + Managers are motivated to only invest in projects that earn more than they cost.
- + EVA makes cost of capital visible to managers.
- + Leads to a reduction in assets employed.
- EVA does not measure present value.
- Rewards quick paybacks and ignores time value of money.

### EVA of US firms - 1997

\$ in millions)	EVA Capital		Return on	Cost of

### Corporate Financing and the Six Lessons of Market Efficiency

### **Chapter 13**

# **Topics Covered**

- We Always Come Back to NPV
- What is an Efficient Market?
  - → Random Walk
- Efficient Market Theory
- The Evidence on Market Efficiency
- Six Lessons of Market Efficiency

# **Return to NPV**

- NPV employs discount rates.
- These discount rates are risk adjusted.
- The risk adjustment is a byproduct of market established prices.
- Adjustable discount rates change asset values.

### **Return to NPV**

#### **Example**

The government is lending you \$100,000 for 10 years at 3% and only requiring interest payments prior to maturity. Since 3% is obviously below market, what is the value of the below market rate loan?

NPV = amount borrowed - PV of interest pmts

- PV of loan repayment

### **Return to NPV**

#### **Example**

The government is lending you \$100,000 for 10 years at 3% and only requiring interest payments prior to maturity. Since 3% is obviously below market, what is the value of the below market rate loan?

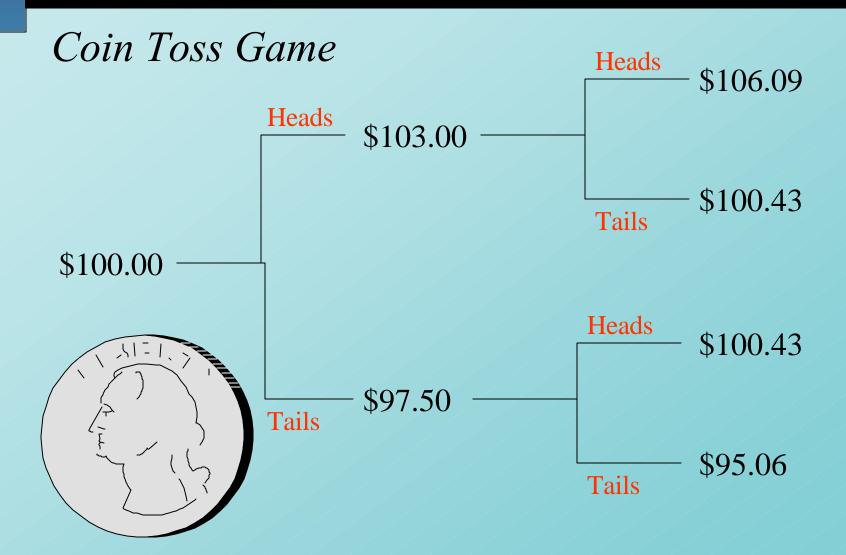

Assume the market return on equivalent risk projects is 10%.

NPV = 100,000 - 
$$\left[\sum_{t=1}^{10} \frac{3,000}{(1.10)^t}\right] - \frac{100,000}{(1.10)^{10}}$$
  
= 100,000 - 56,988  
= \$43,012

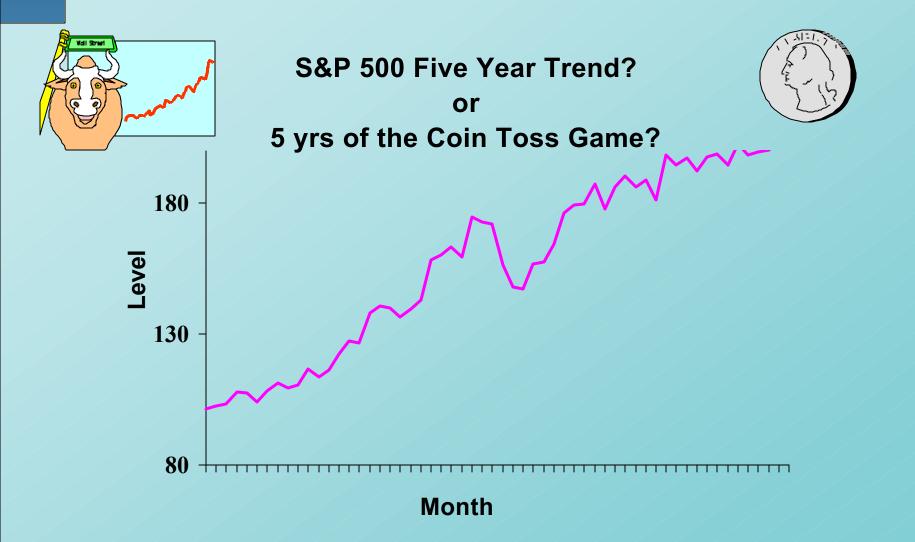

- The movement of stock prices from day to day DO NOT reflect any pattern.
- Statistically speaking, the movement of stock prices is random *(skewed positive over the long term).*

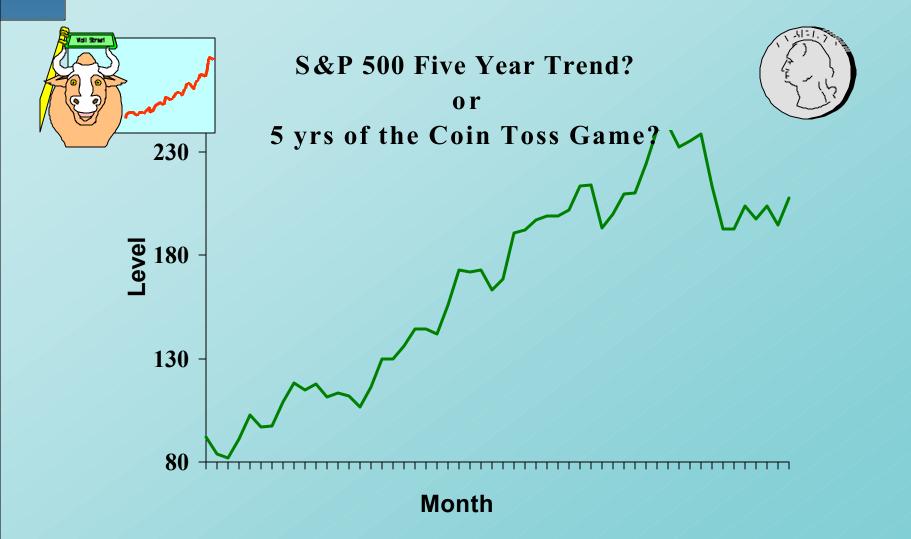

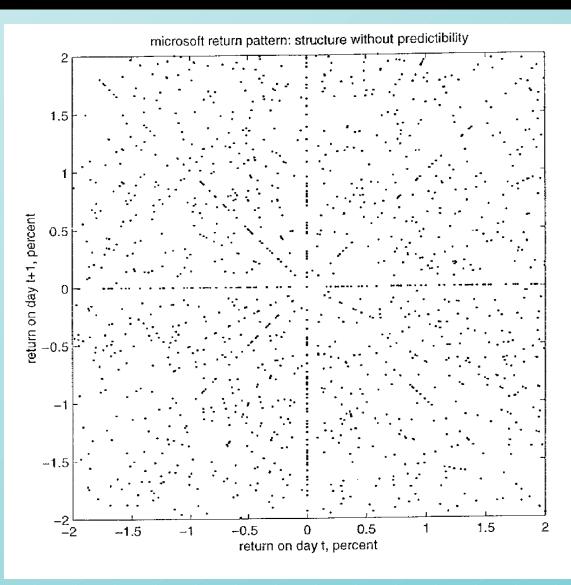

### **Random Walk Theory**

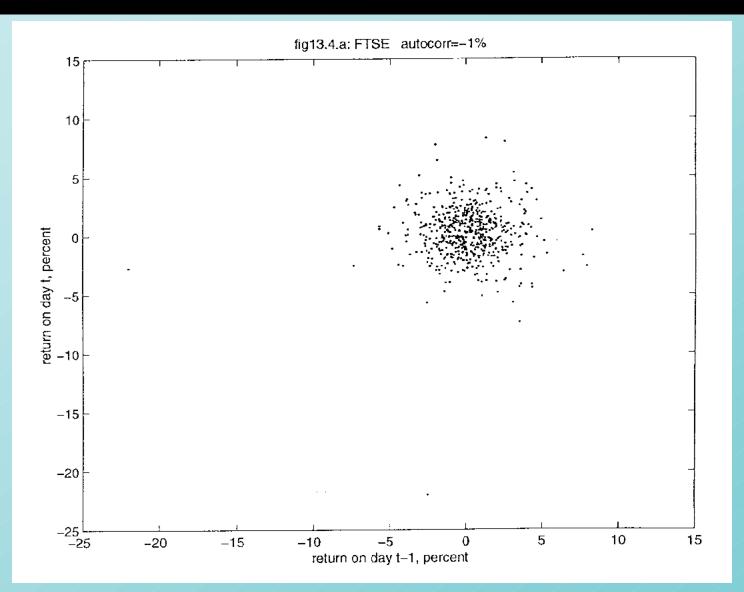

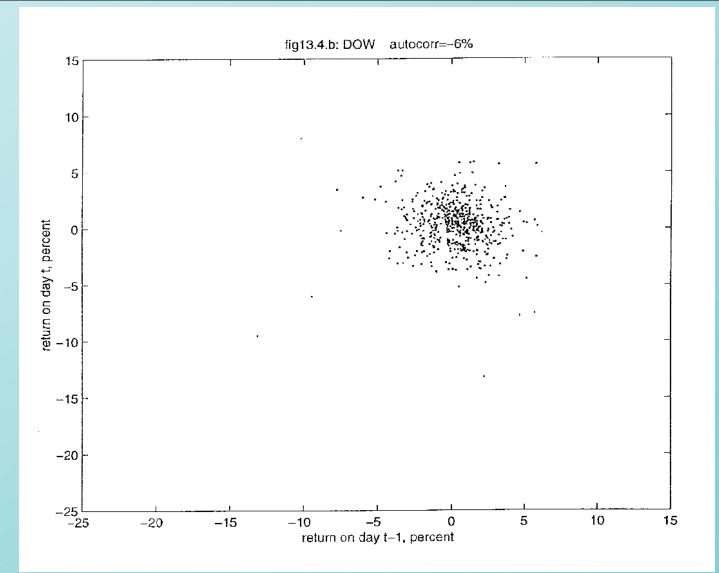

### **Random Walk Theory**

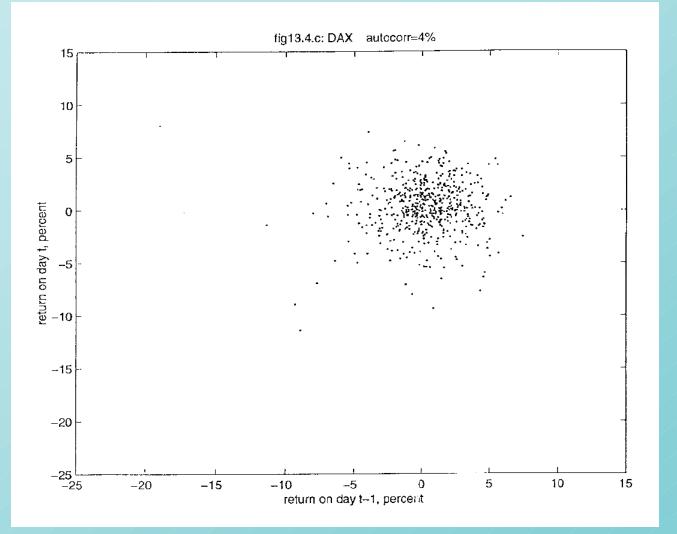

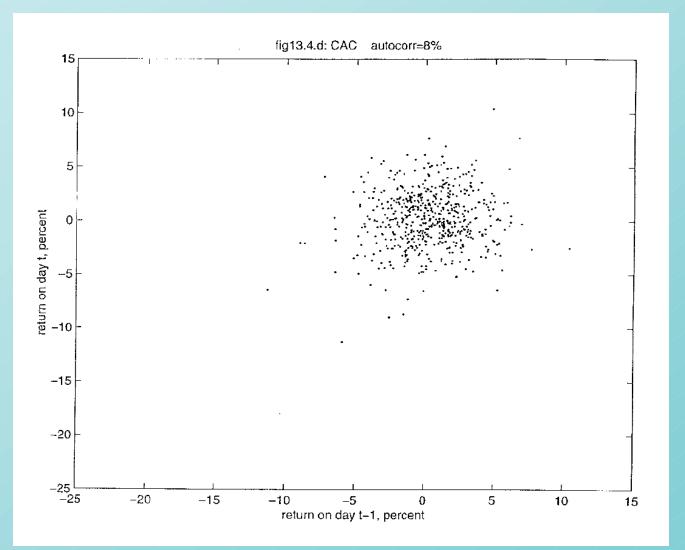

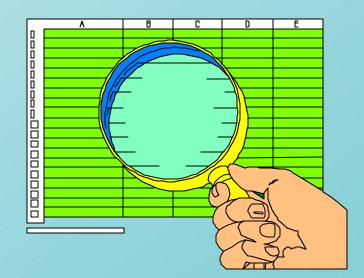

- Weak Form Efficiency
  - → Market prices reflect all historical information.
- Semi-Strong Form Efficiency
  - → Market prices reflect all publicly available information.
- Strong Form Efficiency
  - → Market prices reflect all information, both public and private.

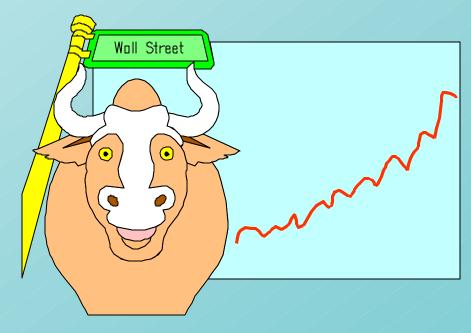

#### Fundamental Analysts

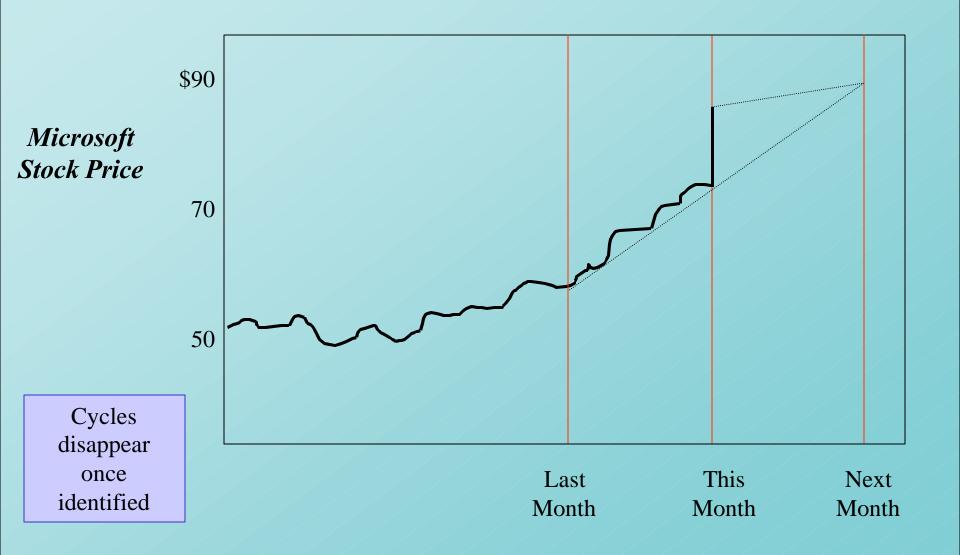

→ Research the value of stocks using NPV and other measurements of cash flow.

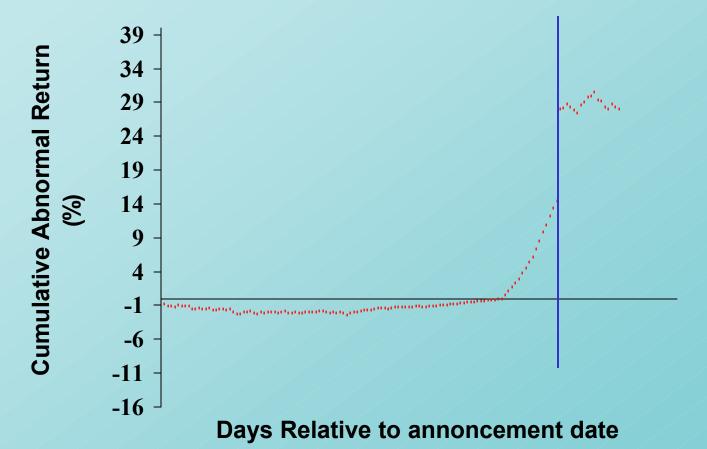

#### Technical Analysts

→ Forecast stock prices based on the watching the fluctuations in historical prices (thus "wiggle watchers").

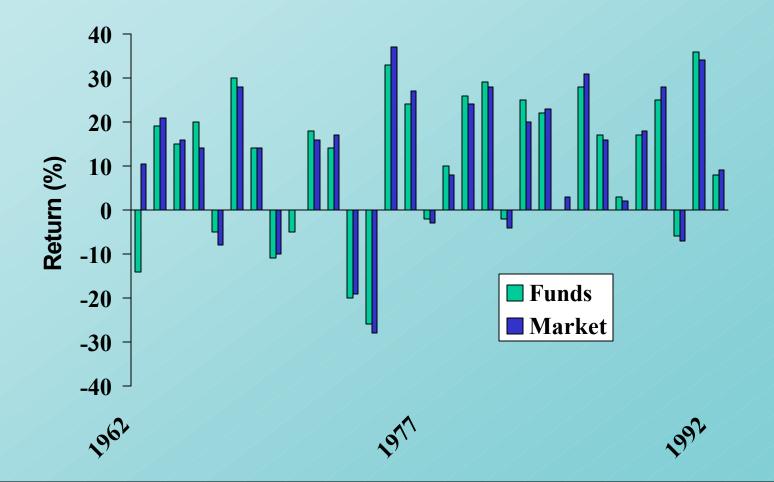

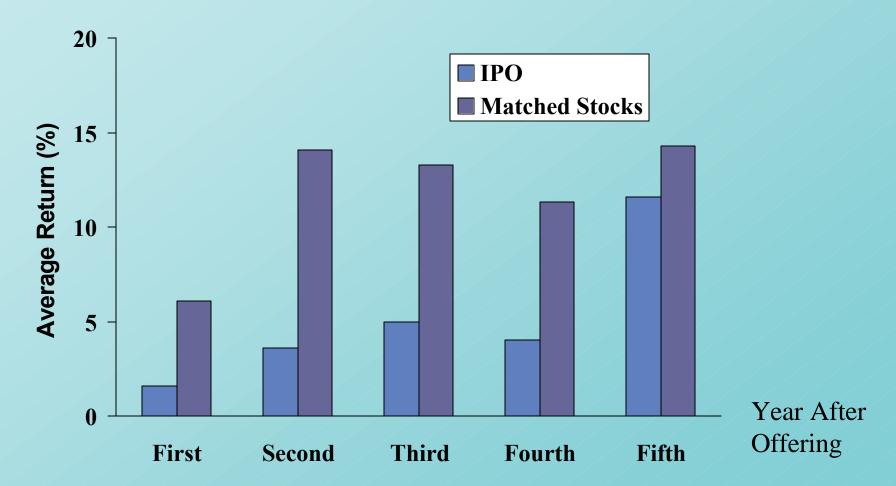

Announcement Date

Average Annual Return on 1493 Mutual Funds and the Market Index

#### **IPO Non-Excess Returns**

#### **1987 Stock Market Crash**

# $PV(index)_{\text{pre crash}} = \frac{Div}{r-g} = \frac{16.7}{.114 - .10} = 1193$

#### **1987 Stock Market Crash**

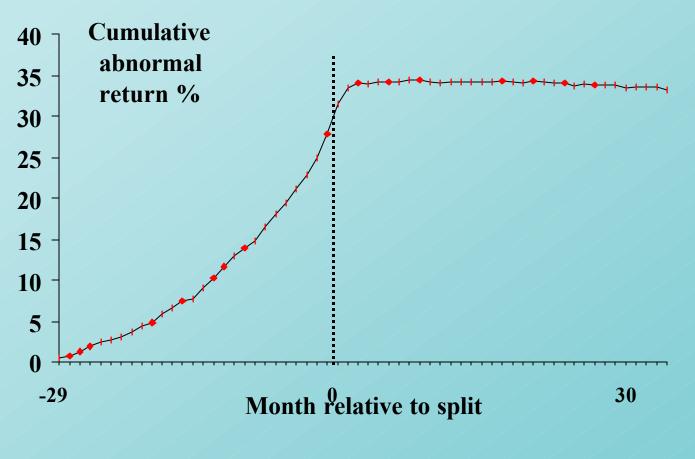

$$PV(index)_{\text{pre crash}} = \frac{Div}{r-g} = \frac{16.7}{.114 - .10} = 1193$$

$$PV(index)_{\text{post crash}} = \frac{Div}{r-g} = \frac{16.7}{.114 - .096} = 928$$

# **Lessons of Market Efficiency**

- Markets have no memory
- **Trust market prices**
- **C**Read the entrails
- There are no financial illusions
- The do it yourself alternative
- Seen one stock, seen them all

### **Common Stock**

#### Book Value vs. Market Value

Book value is a backward looking measure. It tells us how much capital the firm has raised from shareholders in the past. It does not measure the value that shareholders place on those shares today. The market value of the firm is forward looking, it depends on the future dividends that shareholders expect to receive.

# **Common Stock**

**Example** - Mobil Book Value vs. Market Value (12/97) Total Shares outstanding = 783.4 million

Common Shares (\$1 par)	894
Additional paid in capital	1,549
Retained earnings	20,661
Currency adjustment	- 821
Treasury shares at cost	- 3,158
common equity (Book Value)	19,125

Net

### **Common Stock**

**Example** - Mobil Book Value vs. Market Value (12/97) Total Shares outstanding = 783.4 million

Dec 1997 Market price = \$72/sh # of shares x 783.4 Market Value \$56.4 billion

### **Preferred Stock**

**Preferred Stock** - Stock that takes

priority over common stock in regards to dividends.

<u>Net Worth</u> - Book value of common shareholder's equity plus preferred stock.

**Floating-Rate Preferred** - Preferred stock paying dividends that vary with short term interest rates.

- Debt has the unique feature of allowing the borrowers to walk away from their obligation to pay, in exchange for the assets of the company.
- "Default Risk" is the term used to describe the likelihood that a firm will walk away from its obligation, either voluntarily or involuntarily.
- "Bond Ratings" are issued on debt instruments to help investors assess the default risk of a firm.

TABLE 14-5 Large firms typically issue many different securities. This table shows some of the debt securities on Mobil Corporation's balance sheet at the end of 1996 and 1997 (figures in millions).

#### continued

TABLE 14-5 Large firms typically issue many different securities. This table shows some of the debt securities on Mobil Corporation's balance sheet at the end of 1996 and 1997 (figures in millions).

Debt Security	1996	1997
9 5/8% sterling eurobonds 1999	187	182
Variable rate notes 1999	110	
Japanese yen loans 2003-2005	388	347
Variable rate project financing 1998	105	52
Industrial revenue bonds 1998-2030	491	484
Other foreign currencies due 1997-2030	1090	764
Other long-term debt	660	716
Capital leases	247	335
Commercial paper	1634	1097
Bank and other short	894	1168

**Prime Rate** - Benchmark interest rate charged by banks.

- **Funded Debt** Debt with more than 1 year remaining to maturity.
- <u>Sinking Fund</u> Fund established to retire debt before maturity.
- <u>**Callable Bond</u>** Bond that may be repurchased by firm before maturity at specified call price.</u>

<u>Subordinate Debt</u> - Debt that may be repaid in bankruptcy only after senior debt is repaid.

- <u>Secured Debt</u> Debt that has first claim on specified collateral in the event of default.
- Investment Grade Bonds rated Baa or above by Moody's or BBB or above by S&P.
- Junk Bond Bond with a rating below Baa or BBB.

**Eurodollars** - Dollars held on deposit in a bank outside the United States.

**Eurobond** - Bond that is marketed internationally.

<u>**Private Placement</u></u> - Sale of securities to a limited number of investors without a public offering.</u>** 

**Protective Covenants** - Restriction on a firm to protect bondholders.

Lease - Long-term rental agreement.

<u>Warrant</u> - Right to buy shares from a company at a stipulated price before a set date.

<u>**Convertible Bond</u>** - Bond that the holder may exchange for a specified amount of another security.</u>

Convertibles are a combined security, consisting of both a bond and a call option.

### Derivatives

**Traded Options** - A derivative that gives the firm the right (but not the obligation) to buy or sell an asset in the future at a price that is agreed upon today. **Futures** - A contractual obligation entered into in advance to buy or sell an asset or commodity. **Forwards** - A tailor made contract for the purchase of an asset. Not traded on exchanges like futures. **Swaps** - An agreement between two parties to exchange the interest rate characteristics of two loans.

### How Corporations Issue Securities

### **Chapter 15**

## **Topics Covered**

- Venture Capital
- The Initial Public Offering
- The Underwriters
- General Cash Offers
- Rights Issue

#### Money invested to finance a new firm

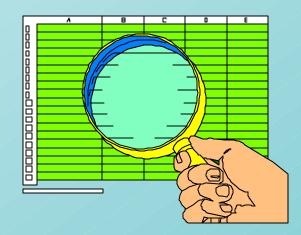

#### **Venture Capital**

Money invested to finance a new firm

Since success of a new firm is highly dependent on the effort of the managers, restrictions are placed on management by the venture capital company and funds are usually dispersed in stages, after a certain level of success is achieved.

#### First Stage Market Value Balance Sheet (\$mil)

Assets		Liabilities and Equity	
Cash from new equity	1.0	New equity from venture capital	1.0
Other assets	1.0	Your original equity	1.0
Value	2.0	Value	2.0

#### Second Stage Market Value Balance Sheet (\$mil)

Assets		Liabilities and Equity	
Cash from new equity	4.0	New equity from 2nd stage	4.0
Fixed assets	1.0	Equity from 1st stage	5.0
Other assets	9.0	Your original equity	5.0
Value	14.0	Value	14.0

## **Initial Offering**

**Initial Public Offering (IPO)** - First offering of stock to the general public.

- <u>Underwriter</u> Firm that buys an issue of securities from a company and resells it to the public.
- **Spread** Difference between public offer price and price paid by underwriter.
- **Prospectus** Formal summary that provides information on an issue of securities.
- <u>**Underpricing</u>** Issuing securities at an offering price set below the true value of the security.</u>

### **Rights Issue**

# **<u>Rights Issue</u>** - Issue of securities offered only to current stockholders.

### **Rights Issue**

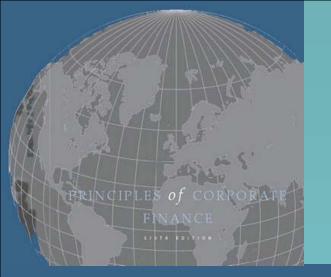

**<u>Rights Issue</u>** - Issue of securities offered only to current stockholders.

**Example** - AEP Corp currently has 11 million shares outstanding. The market price is \$24/sh. AEP decides to raise additional funds via a 1 for 11 rights offer at \$22 per share. If we assume 100% subscription, what is the value of each right?

### **Rights Issue**

**Example** - AEP Corp currently has 11 million shares outstanding. The market price is \$24/sh. AEP decides to raise additional funds via a 1 for 11 rights offer at \$22 per share. If we assume 100% subscription, what is the value of each right?

- $\Rightarrow$  Current Market Value = 2mil x 24 = 264 mil
- $\Rightarrow$  Total Shares = 11 mil + 1 mil = 12 mil
- $\Rightarrow$  Amount of new funds = 1 mil x 22 = 22 mil
- $\Rightarrow$  New Share Price = (264 + 22) / 12 = \$23.83/sh
- $\Rightarrow$  Value of a Right = 24 23.83 = \$0.17

#### **Principles of Corporate Finance**

**Brealey and Myers** 

**Sixth Edition** 

### The Dividend Controversy

### **Chapter 16**

### **Topics Covered**

- How Dividends Are Paid
- How Do Companies Decide on Dividend Payments?
- Information in Dividends and Stock Repurchases
- Dividend Policy is Irrelevant
- The Rightists
- Taxes and the Radical Left
- The Middle of the Roaders

## **Types of Dividends**

- Cash Div
  Regular Cash Div
  Special Cash Div
  Stock Div
  Stock Repurchase (3 methods)
  - 1. Buy shares on the market
  - 2. Tender Offer to Shareholders
  - 3. Private Negotiation (Green Mail)

### **Dividend Payments**

<u>**Cash Dividend</u>** - Payment of cash by the firm to its shareholders.</u>

<u>**Cash Dividend</u>** - Payment of cash by the firm to its shareholders.</u>

**Ex-Dividend Date** - Date that determines whether a stockholder is entitled to a dividend payment; anyone holding stock before this date is entitled to a dividend. <u>**Cash Dividend</u>** - Payment of cash by the firm to its shareholders.</u>

**Ex-Dividend Date** - Date that determines whether a stockholder is entitled to a dividend payment; anyone holding stock before this date is entitled to a dividend.

**Record Date** - Person who owns stock on this date received the dividend.

### **Dividend Payments**

# **Stock Dividend** - Distribution of additional shares to a firm's stockholders.

**Stock Dividend** - Distribution of additional shares to a firm's stockholders.

<u>Stock Splits</u> - Issue of additional shares to firm's stockholders.

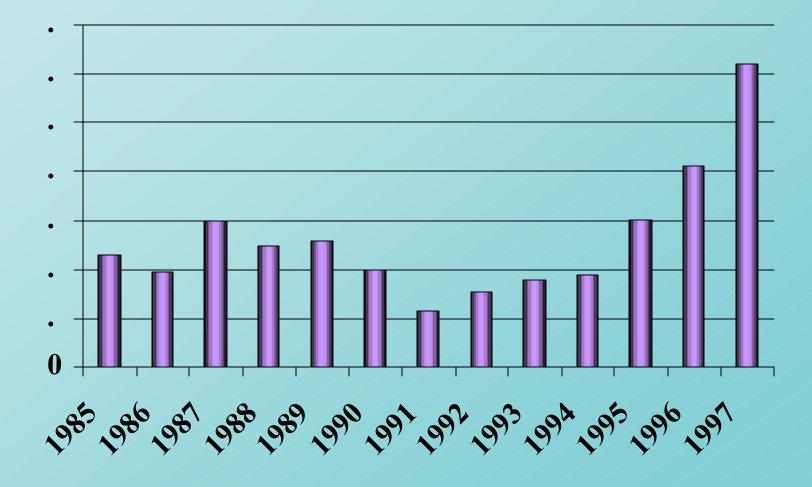

**Stock Dividend** - Distribution of additional shares to a firm's stockholders.

<u>Stock Splits</u> - Issue of additional shares to firm's stockholders.

**Stock Repurchase** - Firm buys back stock from its shareholders.

### **Stock Repurchases**

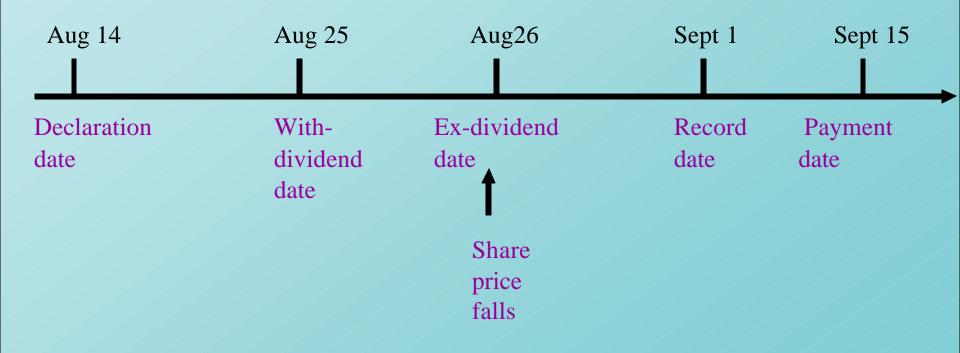

U.S. Stock Repurchases 1985-1997

**\$ Billions** 

### **Dividend Payments**

Maytag's Quarterly Dividend

### **The Dividend Decision**

#### Lintner's "Stylized Facts" (<u>How Dividends are Determined</u>)

- 1. Firms have longer term target dividend payout ratios.
- 2. Managers focus more on dividend changes than on absolute levels.
- 3. Dividends changes follow shifts in long-run, sustainable levels of earnings rather than short-run changes in earnings.
- 4. Managers are reluctant to make dividend changes that might have to be reversed.

Attitudes concerning dividend targets vary

 $DIV_1 = target dividend$ = target ratio × EPS<sub>1</sub>

Dividend Change

 $DIV_1 - DIV_0 = target change$ = target ratio × EPS<sub>1</sub> - DIV<sub>0</sub>

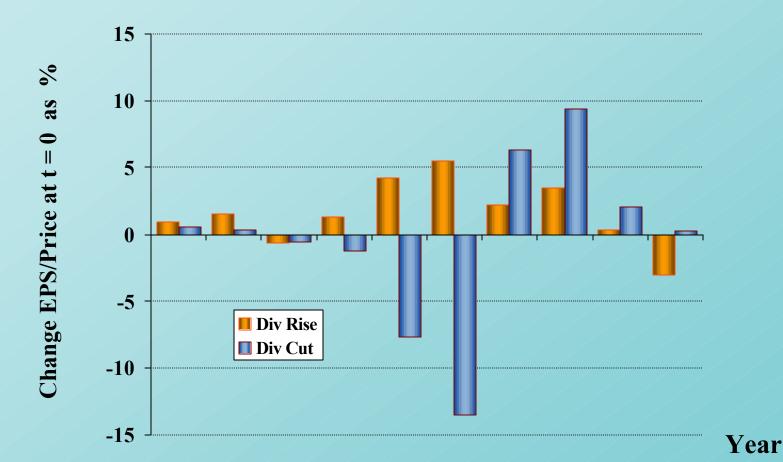

### **The Dividend Decision**

Dividend changes confirm the following:

### $DIV_1 - DIV_0 = adjustment rate \times target change$ = adjustment rate $\times (target ratio \times EPS_1 - DIV_0)$

### **Dividend Policy**

#### Impact of Dividend Changes on EPS

Source: Healy & Palepu (1988)

 Since investors do not need dividends to convert shares to cash they will not pay higher prices for firms with higher dividend payouts. In other words, dividend policy will have no impact on the value of the firm.

**Example** - Assume Rational Demiconductor has no extra cash, but declares a \$1,000 dividend. They also require \$1,000 for current investment needs. Using M&M Theory, and given the following balance sheet information, show how the value of the firm is not altered when new shares are issued to pay for the dividend.

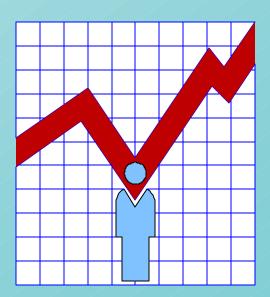

#### Record Date

Cash	1,000
Asset Value	<u>9,000</u>
Total Value	10,000 +
New Proj NPV	2,000
<u># of Shares</u>	<u>1,000</u>
price/share	<b>\$12</b>

**Example** - Assume Rational Demiconductor has no extra cash, but declares a \$1,000 dividend. They also require \$1,000 for current investment needs. Using M&M Theory, and given the following balance sheet information, show how the value of the firm is not altered when new shares are issued to pay for the dividend.

	<u>Record</u>
Stock	12,000
Cash	0
Total Value	12,000

Stock = 1,000 sh @ \$12 = 12,000

# **Dividend Policy is Irrelevant**

#### Example - continued - Shareholder Value

	<u>Record</u>	<u>Pmt</u>
Stock	12,000	11,000
Cash	0	1,000
Total Value	12,000	12,000

Stock = 1,000sh @ \$11 = 11,000

# **Dividend Policy is Irrelevant**

#### Example - continued - Shareholder Value

	Record	<u>Pmt</u>	<u>Post</u>
Stock	12,000	11,000	12,000
Cash	0	1,000	0
Total Value	12,000	12,000	12,000

#### Stock = 1,091sh @ \$115 = 12,000

• Assume stockholders purchase the new issue with the cash dividend proceeds.

### **Dividends Increase Value**

#### **Market Imperfections and Clientele Effect**

There are natural clients for high-payout stocks, but it does not follow that any particular firm can benefit by increasing its dividends. The high dividend clientele already have plenty of high dividend stock to choose from.

These clients increase the price of the stock through their demand for a dividend paying stock.

### **Dividends Increase Value**

#### **Dividends as Signals**

Dividend increases send good news about cash flows and earnings. Dividend cuts send bad news.

Because a high dividend payout policy will be costly to firms that do not have the cash flow to support it, dividend increases signal a company's good fortune and its manager's confidence in future cash flows.

### **Dividends Decrease Value**

#### **Tax Consequences**

Companies can convert dividends into capital gains by shifting their dividend policies. If dividends are taxed more heavily than capital gains, taxpaying investors should welcome such a move and value the firm more favorably.

In such a tax environment, the total cash flow retained by the firm and/or held by shareholders will be higher than if dividends are paid.

- Since capital gains are taxed at a lower rate than dividend income, companies should pay the lowest dividend possible.
- Dividend policy should adjust to changes in the tax code.

	Firm A	Firm B
	(no dividend)	(high dividend)
Next year' s price	112.50	102.50
Dividend	0	10
Total pretax payoff	112.50	112.50
Today' s stock price	100	96.67
Capital gain	12.50	5.83
Pretax rate of return (%)	$\frac{12.5}{100} \times 100 = 12.5$	$\frac{15.83}{96.67} \times 100 = 16.4$
Tax on div @ 50%	0	$.50 \times 10 = 5.00$
Tax on Cap Gain @ 20%	$.20 \times 12.50 = 2.50$	$.20 \times 5.83 = 1.17$
Total After Tax income (div + cap gain - taxes)	(0+12.50) - 2.50 = 10	(10 - 5.83) - (5 + 1.17) = 9.66
After tax rate of return (%)	$\frac{10}{100} \times 100 = 10.0$	$\frac{9.66}{96.67} \times 100 = 10.0$

#### 1998 Marginal Income Tax Brackets

#### **Income Bracket**

Marginal Tax Rate	Single	Married (joint return)
15%	\$0 - \$25,350	\$0 - \$42,350
28	25,351 - 61,400	42,351 - 102,300
31	61,401 - 128,100	102,301 - 155,950
36	128,101 - 278,450	155,951 - 278,450
39.6	over 278,450	over 278,450

In U.S., shareholders are taxed twice (figures in dollars)

-	Rate of Income tax		
-	0%	39.60%	
Operating Income	100	100	
Corporate tax (Tc=.35)	35	35	
After Tax income (paid as div)	65	65	
Income tax	0	25.7	
Cash to Shareholder	65	39.3	

Under imputed tax systems, such as that in Australia, shareholders receive a tax credit for the corporate tax the firm pays (figures in Australian dollars)

	Rate of Income tax			
	15%	33%	47%	
Operating Income	100	100	100	
Corporate tax (Tc=.33)	35	33	33	
After Tax income	67	67	67	
Grossed up Dividend	100	100	100	
Income tax	15	33	47	
Tax credit for Corp Pmt	-33	-33	-33	
Tax due from shareholder	-18	0	14	
Cash to Shareholder	85	67	53

### Does Debt Policy Matter?

### **Chapter 17**

# **Topics Covered**

- Leverage in a Tax Free Environment
- How Leverage Effects Returns
- The Traditional Position

#### Modigliani & Miller

→ When there are no taxes and capital markets function well, it makes no difference whether the firm borrows or individual shareholders borrow. Therefore, the market value of a company does not depend on its capital structure.

#### **Assumptions**

- By issuing 1 security rather than 2, company diminishes investor choice. This does not reduce value if:
  - → Investors do not need choice, OR
  - → There are sufficient alternative securities
- Capital structure does not affect cash flows e.g...
  → No taxes
  - → No bankruptcy costs
  - → No effect on management incentives

#### **Example** - Macbeth Spot Removers - All Equity Financed

Data					621
Number of shares	1,000				<b>60</b> //
Price per share	\$10			1	
Market Value of Shares	\$10,00	)0			and the second s
Outcomes				- subburn	TTT LLANDER

Net earnings on investment	\$0	1.00	2.00	3.00
Return on \$10 investment (%)	0%	10	20	30

Outcomes

# No Magic in Financial Leverage

#### MM'S PROPOSITION I

If capital markets are doing their job, firms cannot increase value by tinkering with capital structure.

V is independent of the debt ratio.

#### AN EVERYDAY ANALOGY

It should cost no more to assemble a chicken than to buy one whole.

### **Proposition I and Macbeth**

Macbeth continued

	Cuttent Structure :	Proposed Structure :	
	All Equity	Equal Debt and Equity	
Expected earnings per share (\$)	1.50	2.00	
Price per share (\$)	10	10	
Expected return per share (%)	15	20	

### Leverage and Returns

Expected return on assets 
$$= r_a = \frac{\text{expected operating income}}{\text{market value of all securities}}$$

$$r_A = \left(\frac{D}{D+A} \times r_D\right) + \left(\frac{E}{D+E} \times r_E\right)$$

# **M&M Proposition II**

$$r_E = r_A + \frac{D}{V} (r_A - r_D)$$

$$r_E = r_A = \frac{\text{expected operating income}}{\text{market value of all securities}}$$
  
=  $\frac{1500}{10,000} = .15$ 

# **M&M Proposition II**

$$r_E = r_A + \frac{D}{V} \left( r_A - r_D \right)$$

 $r_E = r_A = \frac{\text{expected operating income}}{\text{market val ue of all securities}}$ =  $\frac{1500}{10,000} = .15$ 

Macbeth continued

$$r_E = .15 + \frac{5000}{5000} (.15 - .10)$$
$$= .20 \text{ or } 20\%$$

# **M&M Proposition II**

# Leverage and Risk

### Macbeth continued

#### Leverage increases the risk of Macbeth shares

-		Operating	Income
		\$500	\$1,500
All equity	Earnings per share (\$)	.50	1.50
	Return on shares	5	15
50 % debt :	Earnings per share (\$)	0	2
	Return on shares	0	20

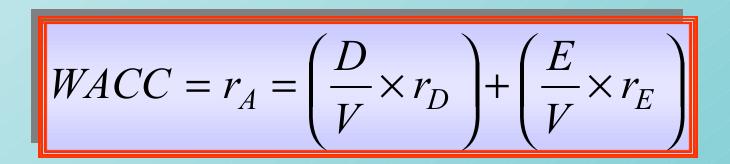

### Leverage and Returns

$$B_{A} = \left(\frac{D}{D+A} \times B_{D}\right) + \left(\frac{E}{D+E} \times B_{E}\right)$$

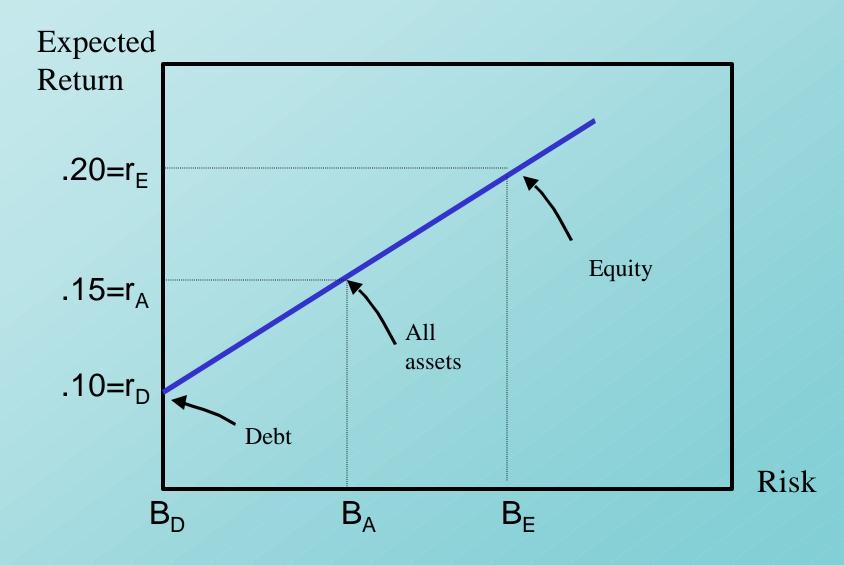

$$B_E = B_A + \frac{D}{V} \left( B_A - B_D \right)$$

# WACC is the traditional view of capital structure, risk and return.

### WACC

**Example** - A firm has \$2 mil of debt and 100,000 of outstanding shares at \$30 each. If they can borrow at 8% and the stockholders require 15% return what is the firm's WACC?

D = million

E = 100,000 shares X \$30 per share = \$3 million

V = D + E = 2 + 3 = \$5 million

### WACC

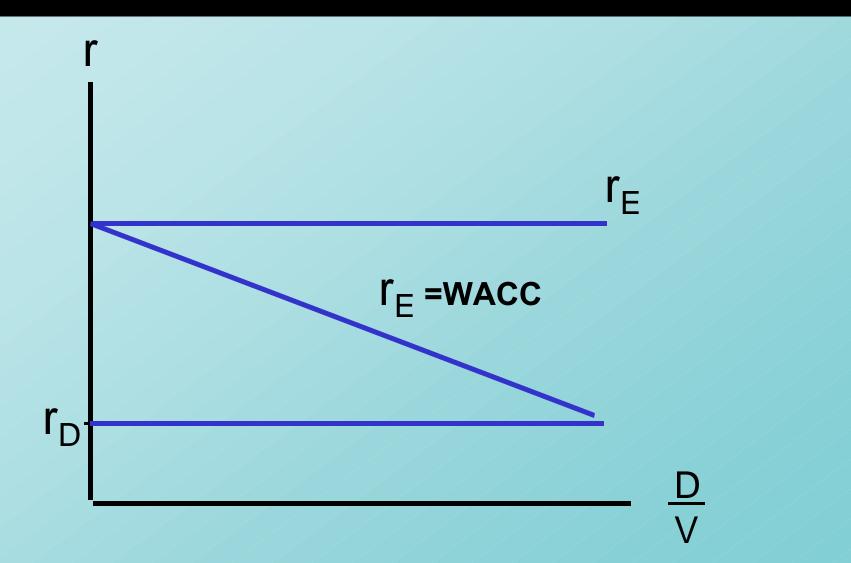

**Example** - A firm has \$2 mil of debt and 100,000 of<br/>outstanding shares at \$30 each. If they can borrow at 8% and<br/>the stockholders require 15% return what is the firm's<br/>WACC?D = \$2 million

E = 100,000 shares X \$30 per share = \$3 million

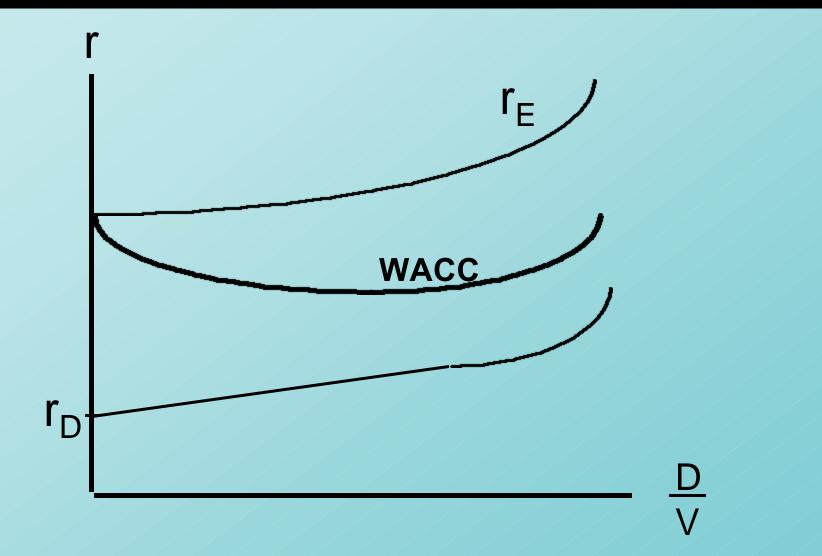

V = D + E = 2 + 3 = \$5 million

$$WACC = \left(\frac{D}{V} \times r_D\right) + \left(\frac{E}{V} \times r_E\right)$$
$$= \left(\frac{2}{5} \times .08\right) + \left(\frac{3}{5} \times .15\right)$$
$$= .122 \text{ or } 12.2\%$$

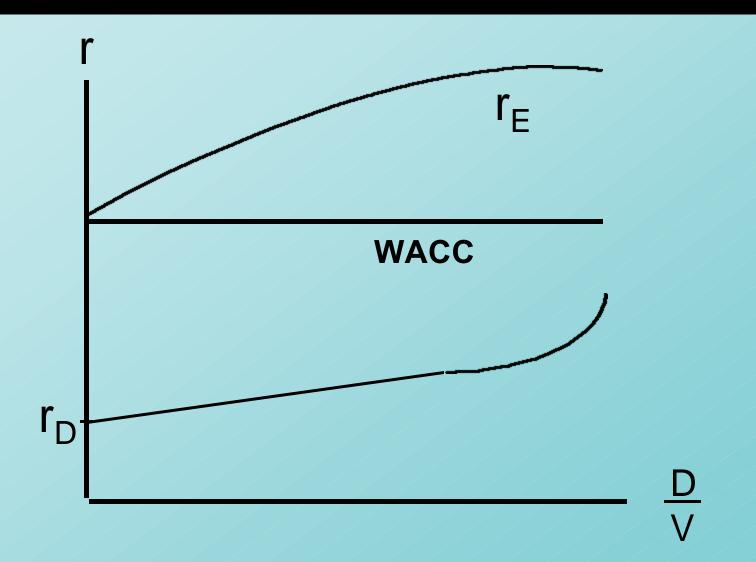

# WACC (traditional view)

# WACC (M&M view)

Should you do this and why?

	All Equity	<u>1/2 Debt</u>	
EBIT	1,000	1,000	
Interest Pmt		<u>100</u>	
Pretax Income	1,000	900 🧝	LEL SED
Taxes @ 40%	<u>400</u>	_360	
Net Cash Flow	<u>\$600</u>	<u>\$540</u>	

# C.S. & Corporate Taxes

Example - You own all the equity of Space Babies Diaper Co.. The company has no debt. The company's annual cash flow is \$1,000, before interest and taxes. The corporate tax rate is 40%. You have the option to exchange 1/2 of your equity position for 10% bonds with a face value of \$1,000. Should you do this and why?

	All Equity	<u>1/2 Debt</u>	
EBIT	1,000	1,000	Total Cash Flow
Interest Pmt		<u>    100  </u>	All Equity = 600
Pretax Income	1,000	900	
Taxes @ 40%	400	<u>    360  </u>	*1/2 Debt = 640
Net Cash Flow	<u>\$600</u>	<u>\$540</u>	(540 + 100)

PV of Tax Shield = 
$$\frac{D \times r_D \times T_C}{r_D} = D \times T_C$$
  
(assume perpetuity)  $r_D$ 

PV of Tax Shield = 
$$\frac{D \times r_D \times Tc}{r_D} = D \times Tc$$

#### Example:

Tax benefit =  $1000 \times (.10) \times (.40) = $40$ 

PV of Tax Shield =  $\frac{D \times r_D \times Tc}{r_D} = D \times Tc$ 

Example:

Tax benefit =  $1000 \times (.10) \times (.40) = $40$ PV of 40 perpetuity = 40 / .10 = \$400

PV of Tax Shield =  $\frac{D \times r_D \times Tc}{r_D} = D \times Tc$ 

Example:

Tax benefit =  $1000 \times (.10) \times (.40) = $40$ PV of 40 perpetuity = 40 / .10 = \$400

PV Tax Shield = D x Tc = 1000 x .4 = <u>\$400</u>

#### Firm Value =

#### Value of All Equity Firm + PV Tax Shield

Firm Value =

Value of All Equity Firm + PV Tax Shield

#### Example

All Equity Value = 600 / .10 = 6,000

Firm Value =

Value of All Equity Firm + PV Tax Shield

#### Example

All Equity Value = 600 / .10 = 6,000PV Tax Shield = 400

Firm Value = Value of All Equity Firm + PV Tax Shield

#### Example

All Equity Value = 600 / .10 = 6,000PV Tax Shield = 400

#### Firm Value with 1/2 Debt = \$6,400

**RAF = 1.381** Advantage Debt

• Today's RAF & Debt vs Equity preference.

RAF =  $\frac{1-.28}{(1-.28)(1-.34)} = 1.52$ 

Old Tax Code

• Today's RAF & Debt vs Equity preference.

RAF =  $\frac{1-.28}{(1-.20)(1-.34)} = 1.36$ 

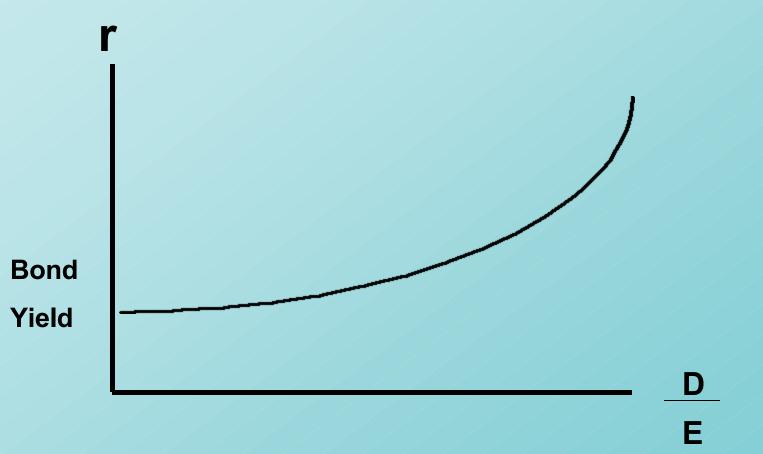

New Tax Code

Today's RAF & Debt vs Equity preference.

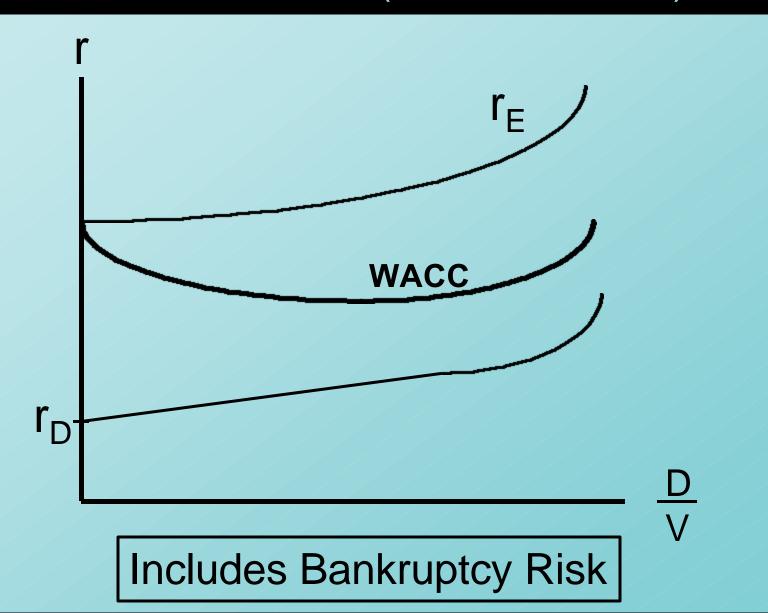

RAF =  $\frac{1-.28}{(1-.20)(1-.34)} = 1.36$ 

Why are companies not all debt?

### **Structure of Bond Yield Rates**

#### Weighted Average Cost of Capital without taxes (traditional view)

### **Financial Distress**

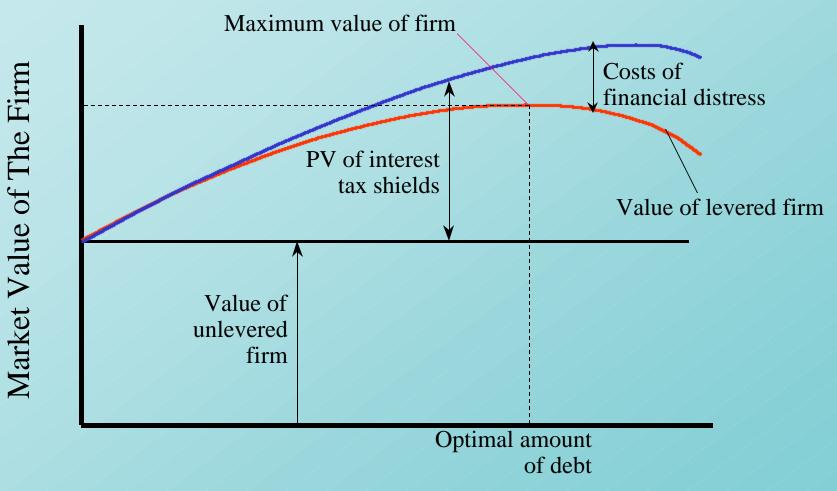

<u>Costs of Financial Distress</u> - Costs arising from bankruptcy or distorted business decisions before bankruptcy.

### **Financial Distress**

<u>Costs of Financial Distress</u> - Costs arising from bankruptcy or distorted business decisions before bankruptcy.

Market Value = Value if all Equity Financed + PV Tax Shield - PV Costs of Financial Distress

### **Financial Distress**

Debt

### **Conflicts of Interest**

Circular File Company has \$50 of 1-year debt.

Circular File Cor	npany (Bool	k Values)	
Net W.C.	20	50	Bonds outstanding
Fixed assets	<u>80</u>	<u>50</u>	Common stock
Total assets	100	100	Total liabilities

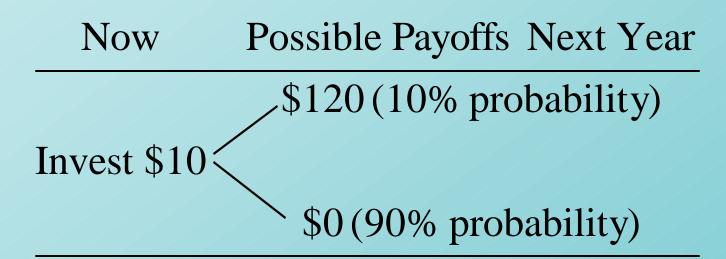

# **Conflicts of Interest**

Circular File Company has \$50 of 1-year debt.

Circular File Con	npany (Marl	ket Value	es)
Net W.C.	20	25	Bonds outstanding
Fixed assets	<u>10</u>	<u>5</u>	Common stock
Total assets	30	30	Total liabilities

- Why does the equity have any value ?
- Shareholders have an option -- they can obtain the rights to the assets by paying off the \$50 debt.

# *Circular File Company has may invest \$10 as follows.*

Assume the NPV of the project is (-\$2). What is the effect on the market values?

### **Conflicts of Interest**

Circular File Company value (post project)

Circular File Cor	npany (Marl	ket Value	es)
Net W.C.	10	20	Bonds outstanding
Fixed assets	<u>18</u>	<u>8</u>	Common stock
Total assets	28	28	Total liabilities

• Firm value falls by \$2, but equity holder gains \$3

**Circular File Company value** (assumes a safe project with NPV = \$5)

Circular File Company (Market Values)			
Net W.C.	20	33	Bonds outstanding
Fixed assets	<u>25</u>	<u>12</u>	Common stock
Total assets	45	45	Total liabilities

• While firm value rises, the lack of a high potential payoff for shareholders causes a decrease in equity value.

### **Financial Distress Games**

#### **Cash In and Run**

### Playing for Time

#### Bait and Switch

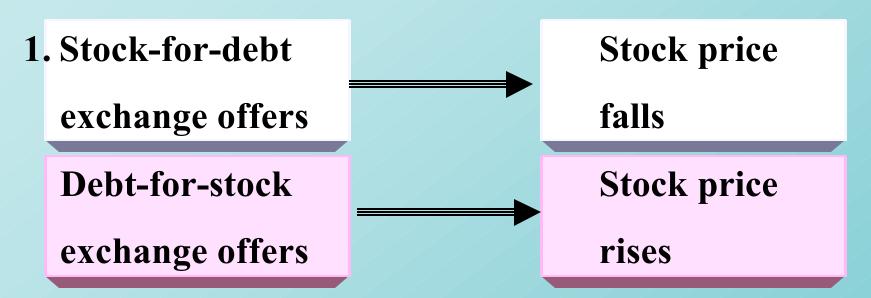

# **Financial Choices**

<u>**Trade-off Theory</u></u> - Theory that capital structure is based on a trade-off between tax savings and distress costs of debt.</u>** 

<u>Pecking Order Theory</u> - Theory stating that firms prefer to issue debt rather than equity if internal finance is insufficient.

# **Trade Off Theory & Prices**

- 2. Issuing common stock drives down stock prices; repurchase increases stock prices.
- 3. Issuing straight debt has a small negative impact.

• Why do security issues affect stock price? The demand for a firm's securities ought to be flat.

Any firm is a drop in the bucket.

- Plenty of close substitutes.
- Large debt issues don't significantly depress the stock price.

# **Pecking Order Theory**

Consider the following story:

The announcement of a stock issue drives down the stock price because investors believe managers are more likely to issue when shares are overpriced.

Therefore firms prefer internal finance since funds can be raised without sending adverse signals.

If external finance is required, firms issue debt first and equity as a last resort.

The most profitable firms borrow less not because they have lower target debt ratios but because they don't need external finance.

# **Pecking Order Theory**

#### Some Implications:

- Internal equity may be better than external equity.
- ⇒ Financial slack is valuable.
- If external capital is required, debt is better. (There is less room for difference in opinions about what debt is worth).

#### **Principles of Corporate Finance**

**Brealey and Myers** 

**Sixth Edition** 

 Interactions of Investment and Financing Decisions

### **Chapter 19**

# **Topics Covered**

- After Tax WACC
- Tricks of the Trade
- Capital Structure and WACC
- Adjusted Present Value

- The tax benefit from interest expense deductibility must be included in the cost of funds.
- This tax benefit reduces the effective cost of debt by a factor of the marginal tax rate.

$$WACC = \left(\frac{D}{V} \times r_D\right) + \left(\frac{E}{V} \times r_E\right)$$

Old Formula

#### Tax Adjusted Formula

 $WACC = (1 - Tc) \left( \frac{D}{V} \times r_D \right) + \left( \frac{E}{V} \times r_E \right)$ 

#### **Example - Sangria Corporation**

The firm has a marginal tax rate of 35%. The cost of equity is 14.6% and the pretax cost of debt is 8%. Given the book and market value balance sheets, what is the tax adjusted WACC?

#### **Example - Sangria Corporation - continued**

Balance Sheet (Book Value, millions)				
100	50	Debt		
	<u>50</u>	Equity		
100	100	Total liabilities		
	100	100 50 <u>50</u>		

#### **Example - Sangria Corporation - continued**

Balance Sheet	(Market Value	e, millions	)

Assets	125	50	Debt	
		<u>75</u>	Equity	
Total assets	125	125	Total liabilities	

**Example - Sangria Corporation - continued** 

Debt ratio = (D/V) = 50/125 = .4 or 40%

Equity ratio = (E/V) = 75/125 = .6 or 60%

$$WACC = (1 - Tc) \left( \frac{D}{V} \times r_D \right) + \left( \frac{E}{V} \times r_E \right)$$

**Example - Sangria Corporation - continued** 

$$WACC = (1 - Tc) \left( \frac{D}{V} \times r_D \right) + \left( \frac{E}{V} \times r_E \right)$$

$$WACC = (1 - .35) \left( \frac{50}{125} \times .08 \right) + \left( \frac{75}{125} \times .146 \right)$$
$$= .1084$$
$$= 10.84\%$$

**Example - Sangria Corporation - continued** 

The company would like to invest in a perpetual crushing machine with cash flows of \$2.085 million per year pre-tax.

Given an initial investment of \$12.5 million, what is the value of the machine?

#### **Example - Sangria Corporation - continued**

The company would like to invest in a perpetual crushing machine with cash flows of \$2.085 million per year pre-tax. Given an initial investment of \$12.5 million, what is the value of the machine?

Cash Flows	
Pretax cash flow	2.085
Tax @ 35%	0.73
After-tax cash flow	\$1.355 million

#### **Example - Sangria Corporation - continued**

The company would like to invest in a perpetual crushing machine with cash flows of \$2.085 million per year pre-tax. Given an initial investment of \$12.5 million, what is the value of the machine?

$$NPV = C_0 + \frac{C_1}{r - g}$$
  
= -12.5 +  $\frac{1.355}{.1084}$   
= 0

 Preferred stock and other forms of financing must be included in the formula.

$$WACC = (1 - Tc) \left( \frac{D}{V} \times r_D \right) + \left( \frac{P}{V} \times r_P \right) + \left( \frac{E}{V} \times r_E \right)$$

#### **Example - Sangria Corporation - continued**

Calculate WACC given preferred stock is \$25 mil of total equity and

yields 10%.

Balance Sheet (Market Value, millions)

Assets	125	50	Debt
		25	Preferred Equity
		<u>50</u>	Common Equity
Total assets	125	125	Total liabilities

$$WACC = (1 - .35) \left( \frac{50}{125} \times .08 \right) + \left( \frac{25}{125} \times .10 \right) + \left( \frac{50}{125} \times .146 \right)$$
  
= .1104  
= 11.04%

## **Tricks of the Trade**

- What should be included with debt?
  - → Long-term debt?
  - → Short-term debt?
  - → Cash (netted off?)
  - → Receivables?
  - → Deferred tax?

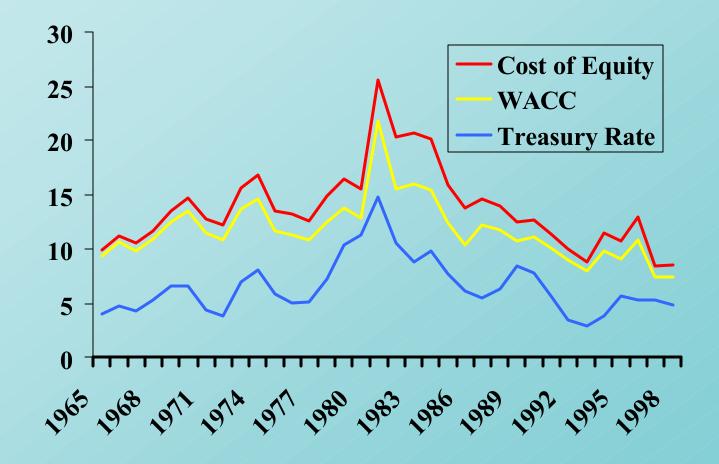

# **Tricks of the Trade**

- How are costs of financing determined?
  - → Return on equity can be derived from market data.
  - → Cost of debt is set by the market given the specific rating of a firm's debt.
  - → Preferred stock often has a preset dividend rate.

### **Historical WACC**

486

Percent

# WACC vs. Flow to Equity

 $\rightarrow$  If you discount at WACC, cash flows have to be projected just as you would for a capital investment project. Do not deduct interest. Calculate taxes as if the company were 41-equity financed. The value of interest tax shields is picked up in the WACC formula.

# WACC vs. Flow to Equity

→ The company's cash flows will probably not be forecasted to infinity. Financial managers usually forecast to a medium-term horizon -- ten years, say -- and add a terminal value to the cash flows in the horizon year. The terminal value is the present value at the horizon of posthorizon flows. Estimating the terminal value requires careful attention, because it often accounts for the majority of the value of the company.

# WACC vs. Flow to Equity

→ Discounting at WACC values the assets and operations of the company. If the object is to value the company's equity, that is, its common stock, don't forget to subtract the value of the company's outstanding debt.

APV = Base Case NPV + PV Impact

- Base Case = All equity finance firm NPV.
- PV Impact = all costs/benefits directly resulting from project.

#### example:

Project A has an NPV of \$150,000. In order to finance the project we must issue stock, with a brokerage cost of \$200,000.

#### example:

Project A has an NPV of \$150,000. In order to finance the project we must issue stock, with a brokerage cost of \$200,000.

Project NPV =150,000Stock issue cost =-200,000Adjusted NPV-50,000

don't do the project

#### example:

Project B has a NPV of -\$20,000. We can issue debt at 8% to finance the project. The new debt has a PV Tax Shield of \$60,000. Assume that Project B is your only option.

example:

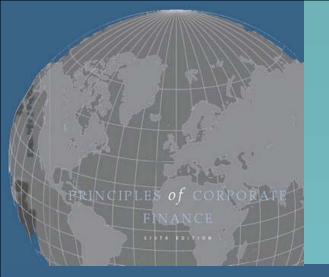

Project B has a NPV of -\$20,000. We can issue debt at 8% to finance the project. The new debt has a PV Tax Shield of \$60,000. Assume that Project B is your only option.

Project NPV =-20,000Stock issue cost =60,000Adjusted NPV40,000

do the project

### Miles and Ezzell

Right to sell an asset at a specified exercise price on or before the exercise date.

# **Option Obligations**

# **Option Value**

• The value of an option at expiration is a function of the stock price and the exercise price.

• The value of an option at expiration is a function of the stock price and the exercise price.

**Example** - Option values given a exercise price of \$85

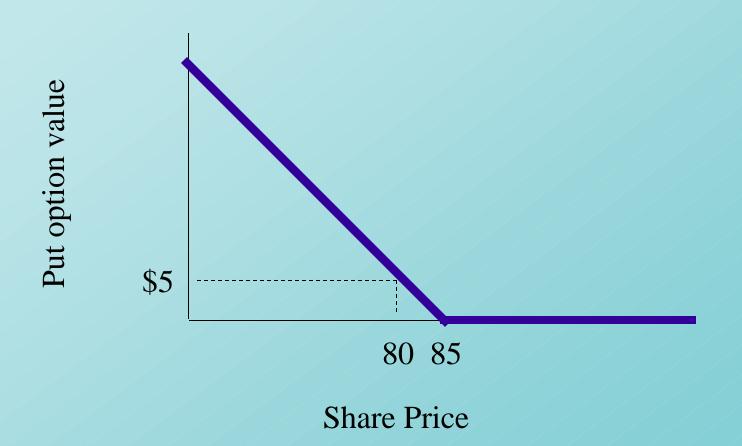

Stock Price	\$60	70	80	90	100	110
Call Value	0	0	0	5	15	25
Put Value	25	15	5	0	0	0

## **Option Value**

Call option value (graphic) given a \$85 exercise price.

Put option value (graphic) given a \$85 exercise price.

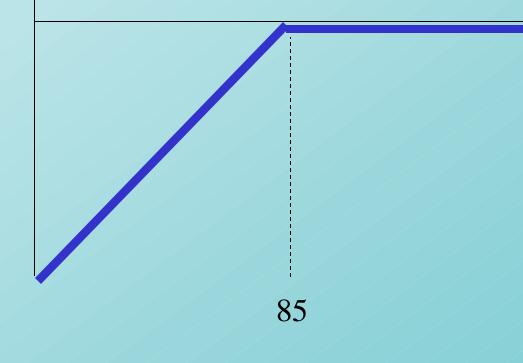

Call option payoff (to seller) given a \$85 exercise price.

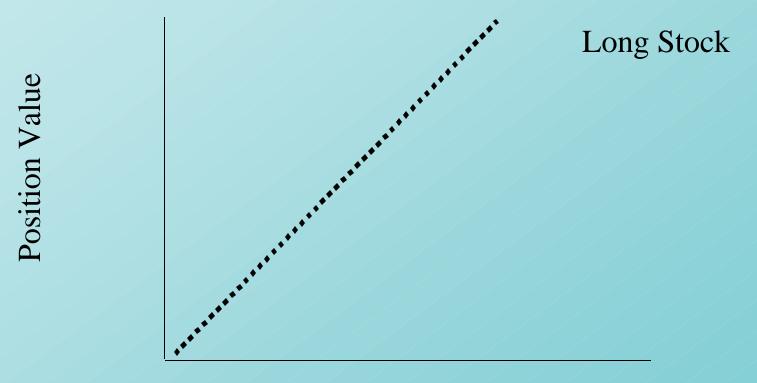

Put option payoff (to seller) given a \$85 exercise price.

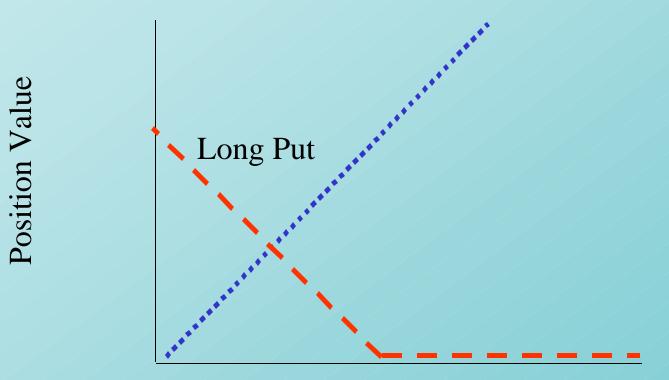

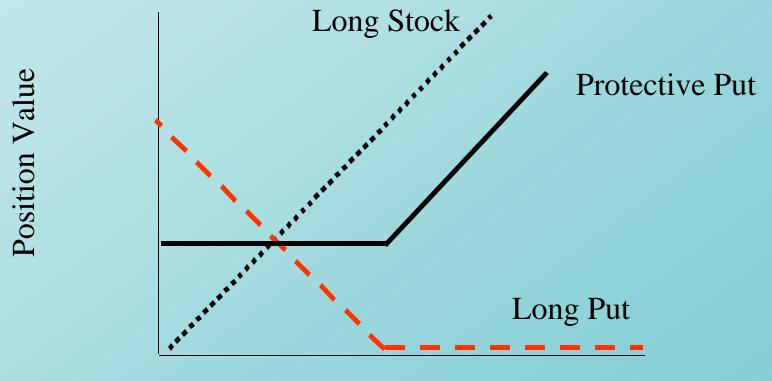

### Protective Put - Long stock and long put

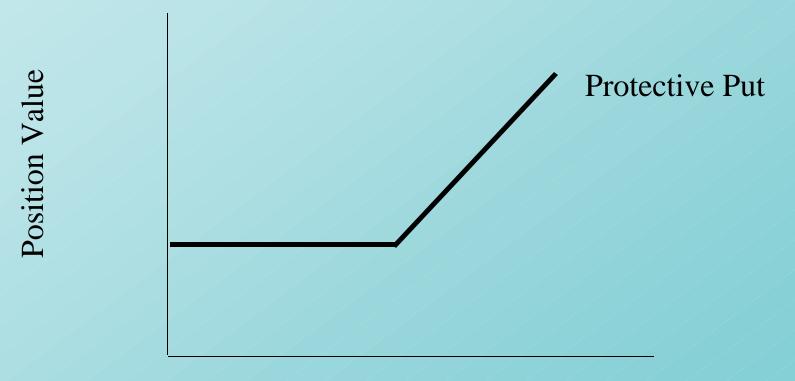

### Protective Put - Long stock and long put

### Protective Put - Long stock and long put

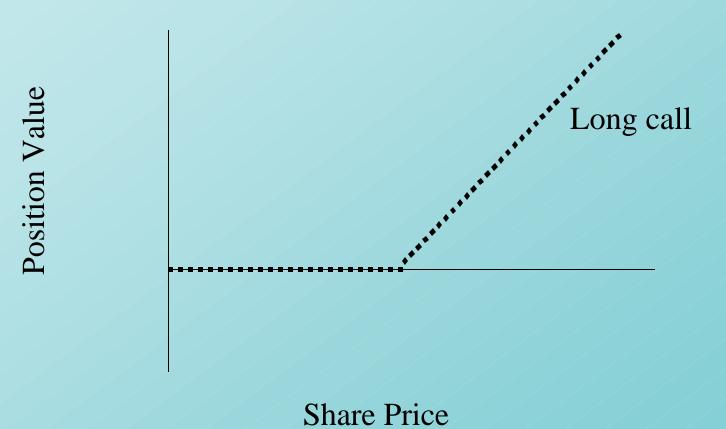

### Protective Put - Long stock and long put

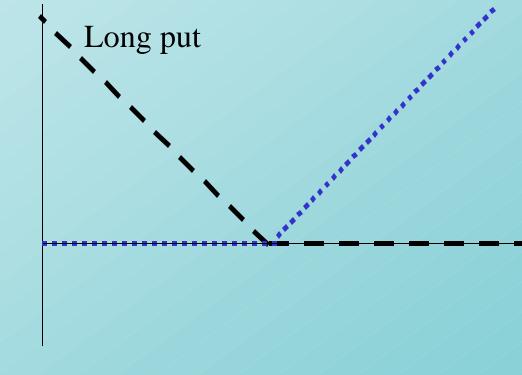

Straddle - Long call and long put

- Strategy for profiting from high volatility

Straddle - Long call and long put

- Strategy for profiting from high volatility

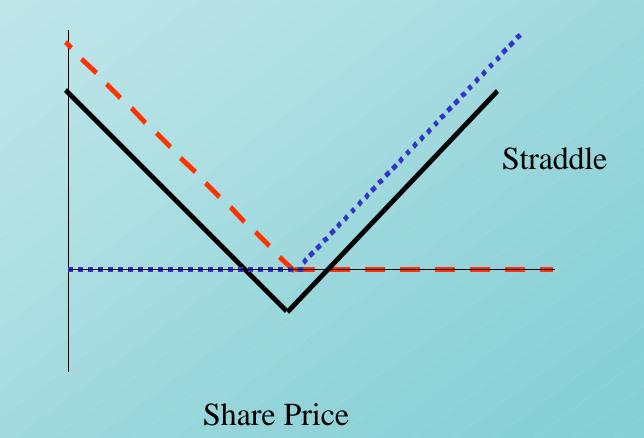

Share Price

**Position Value** 

Straddle - Long call and long put

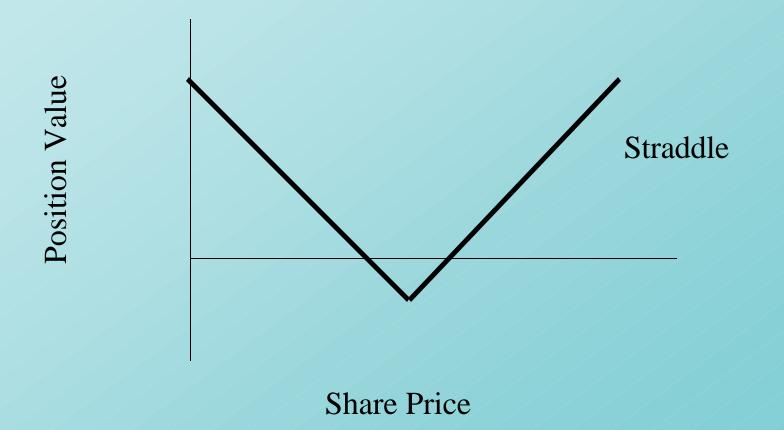

- Strategy for profiting from high volatility

**Position Value** 

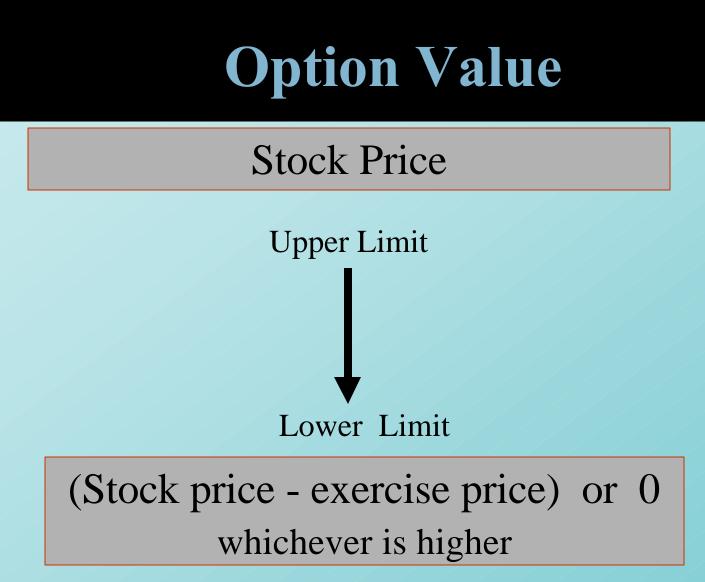

Straddle - Long call and long put

- Strategy for profiting from high volatility

### **Stock Price**

Upper Limit

### **Components of the Option Price**

- 1 Underlying stock price
- 2 Striking or Exercise price
- 3 Volatility of the stock returns (standard deviation of annual returns)
- 4 Time to option expiration
- 5 Time value of money (discount rate)

### **Black-Scholes Option Pricing Model**

 $O_{C} = P_{s}[N(d_{1})] - S[N(d_{2})]e^{-rt}$ 

### <u>Black-Scholes Option Pricing Model</u>

$$O_{C} = P_{s}[N(d_{1})] - S[N(d_{2})]e^{-rt}$$

- O<sub>C</sub>- Call Option Price
- $\mathbf{P}_{\rm s}$  Stock Price
- $N(d_1)$  Cumulative normal density function of  $(d_1)$
- S Strike or Exercise price
- N(d<sub>2</sub>) Cumulative normal density function of (d<sub>2</sub>)
- r discount rate (90 day comm paper rate or risk free rate)
- t time to maturity of option (as % of year)
- v volatility annualized standard deviation of daily returns

### **Black-Scholes Option Pricing Model**

### **Cumulative Normal Density Function**

$$(d_1) = \frac{\ln \frac{P_s}{S} + (r + \frac{v^2}{2})t}{v\sqrt{t}}$$

$$(d_2) = d_1 - v \sqrt{t}$$

#### Example

What is the price of a call option given the following?

- P = 36 r = 10% v = .40
- S = 40 t = 90 days / 365

#### Example

What is the price of a call option given the following?

- P = 36 r = 10% v = .40
- S = 40 t = 90 days / 365

$$(d_1) = \frac{\ln \frac{P_s}{S} + (r + \frac{v^2}{2})t}{v\sqrt{t}}$$

 $(d_1) = -.3070$   $N(d_1) = 1 - .6206 = .3794$ 

#### Example

What is the price of a call option given the following?

- P = 36 r = 10% v = .40
- S = 40 t = 90 days / 365

$$(\mathbf{d}_2) = \mathbf{d}_1 - \mathbf{v} \sqrt{\mathbf{t}}$$

 $(d_2) = -.5056$ 

 $N(d_2) = 1 - .6935 = .3065$ 

#### Example

What is the price of a call option given the following?

S = 40 t = 90 days / 365

 $O_{C} = P_{s}[N(d_{1})] - S[N(d_{2})]e^{-rt}$  $O_{C} = 36[.3794] - 40[.3065]e^{-(.10)(.2466)}$  $O_{C} = $1.70$ 

### Put Price = Oc + S - P - Carrying Cost + Div.

Carrying cost = r x S x t

## **Put - Call Parity**

### Example

ABC is selling at \$41 a share. A six month May 40 Call is selling for \$4.00. If a May \$ .50 dividend is expected and r=10%, what is the put price?

## **Put - Call Parity**

### Example

ABC is selling at \$41 a share. A six month May 40 Call is selling for \$4.00. If a May \$ .50 dividend is expected and r=10%, what is the put price?

#### **Op = Oc + S - P - Carrying Cost + Div.**

$$Op = 4 + 40 - 41 - (.10x 40 x .50) + .50$$

$$Op = 3 - 2 + .5$$

Op = \$1.50

### **Principles of Corporate Finance**

**Brealey and Myers** 

**Sixth Edition** 

### **Chapter 21**

# **Topics Covered**

- Real Options
  - → Follow Up Investments
  - → Abandon
  - → Wait
  - → Vary Output or Production
- Binomial Model

# **Corporate Options**

### 4 types of "Real Options"

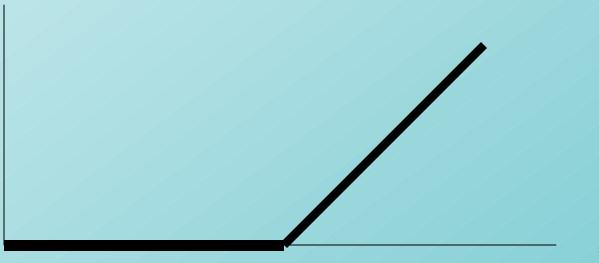

- 1 The opportunity to make follow-up investments.
- 2 The opportunity to abandon a project
- 3 The opportunity to "wait" and invest later.
- 4 The opportunity to vary the firm's output or production methods.

Value "Real Option" = NPV with option - NPV w/o option

## **Option to Wait**

#### Intrinsic Value

Option Price

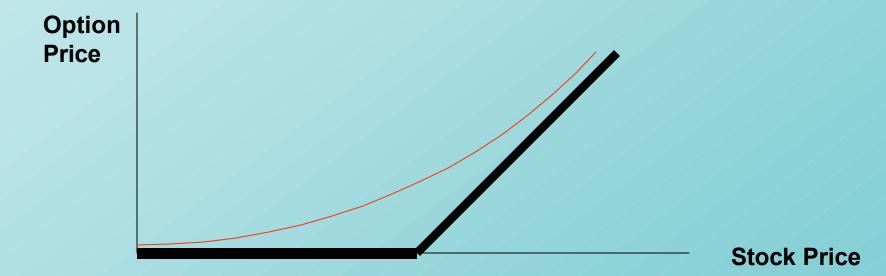

## **Option to Wait**

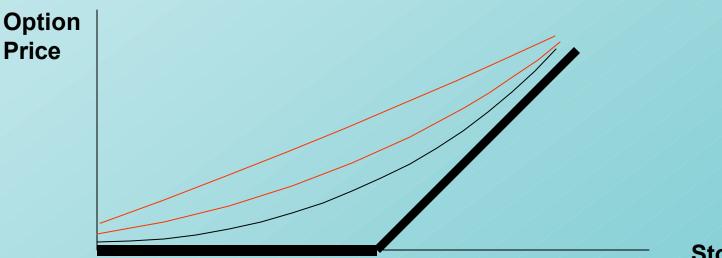

Intrinsic Value + Time Premium = Option Value

Time Premium = Vale of being able to wait

## **Option to Wait**

#### More time = More value

**Stock Price** 

# **Option to Abandon**

### Example - Abandon

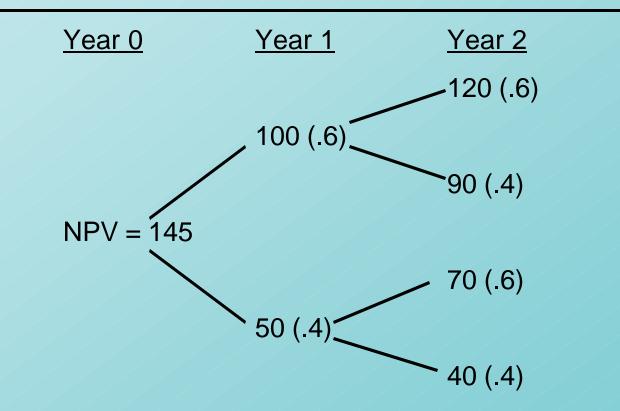

Mrs. Mulla gives you a non-retractable offer to buy your company for \$150 mil at anytime within the next year. Given the following decision tree of possible outcomes, what is the value of the offer (i.e. the put option) and what is the most Mrs. Mulla could charge for the option?

Use a discount rate of 10%

## **Option to Abandon**

#### Example - Abandon

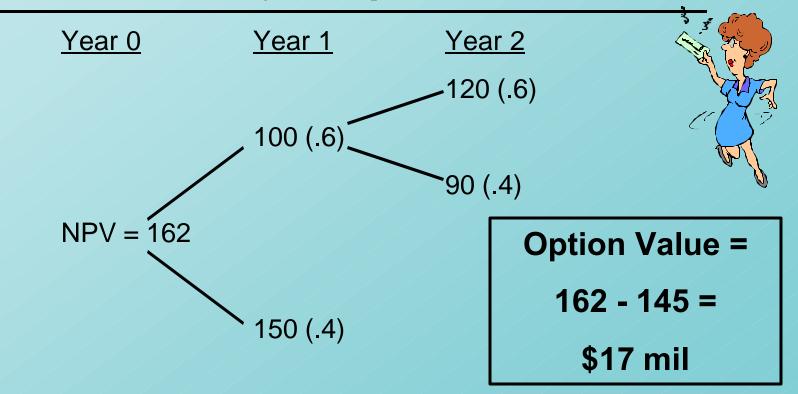

Mrs. Mulla gives you a non-retractable offer to buy your company for \$150 mil at anytime within the next year. Given the following decision tree of possible outcomes, what is the value of the offer (i.e. the put option) and what is the most Mrs. Mulla could charge for the option?

## **Option to Abandon**

#### Example - Abandon

Mrs. Mulla gives you a non-retractable offer to buy your company for \$150 mil at anytime within the next year. Given the following decision tree of possible outcomes, what is the value of the offer (i.e. the put option) and what is the most Mrs. Mulla could charge for the option?

# **Corporate Options**

### <u>Reality</u>

- Decision trees for valuing "real options" in a corporate setting can not be practically done by hand.
- We must introduce binomial theory & B-S models

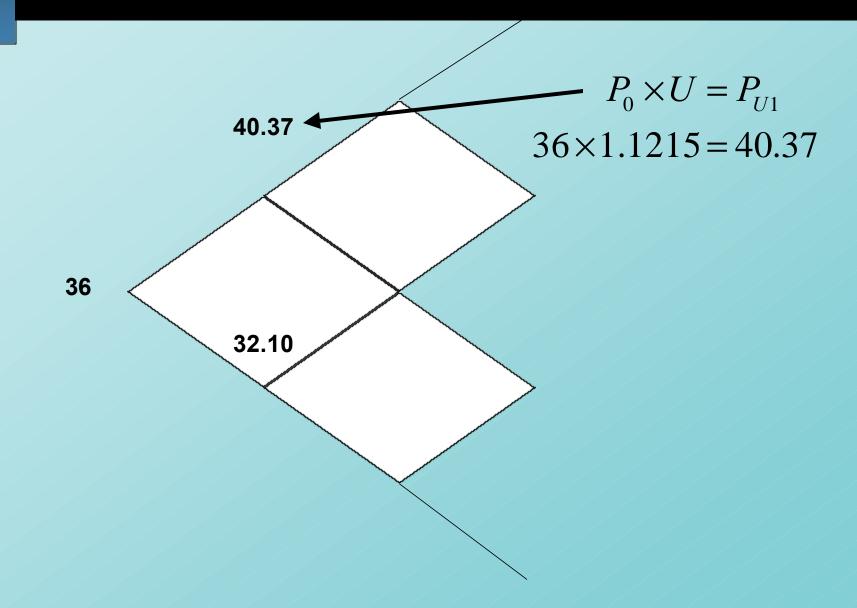

# **Binomial Pricing**

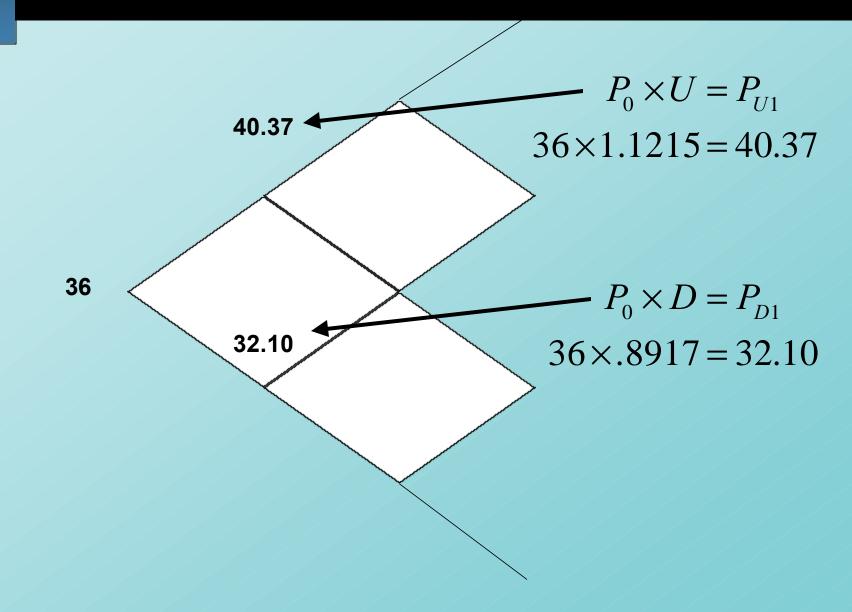

- Probability  $Up = p = (\underline{a d})$  Prob Down = 1 p (u - d)
- $\mathbf{a} = \mathbf{e}^{\mathbf{r}\mathbf{D}t}$   $\mathbf{d} = \mathbf{e}^{-\mathbf{s} [\mathbf{D}t]^{.5}}$   $\mathbf{u} = \mathbf{e}^{\mathbf{s} [\mathbf{D}t]^{.5}}$

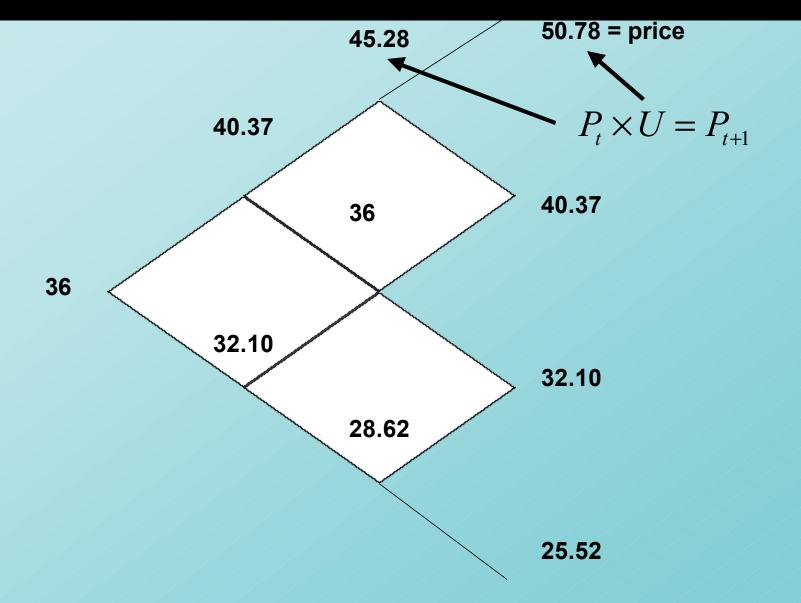

### **D**t = time intervals as % of year

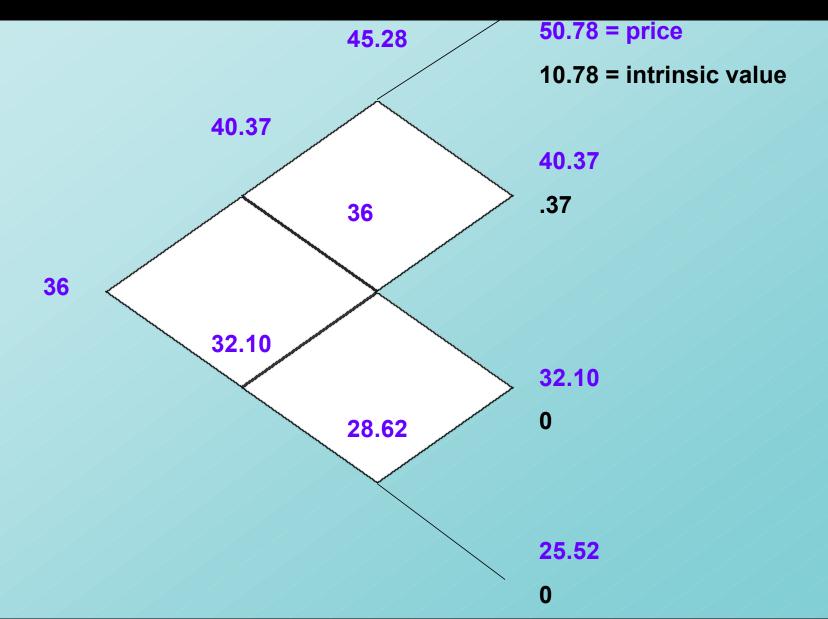

#### Example

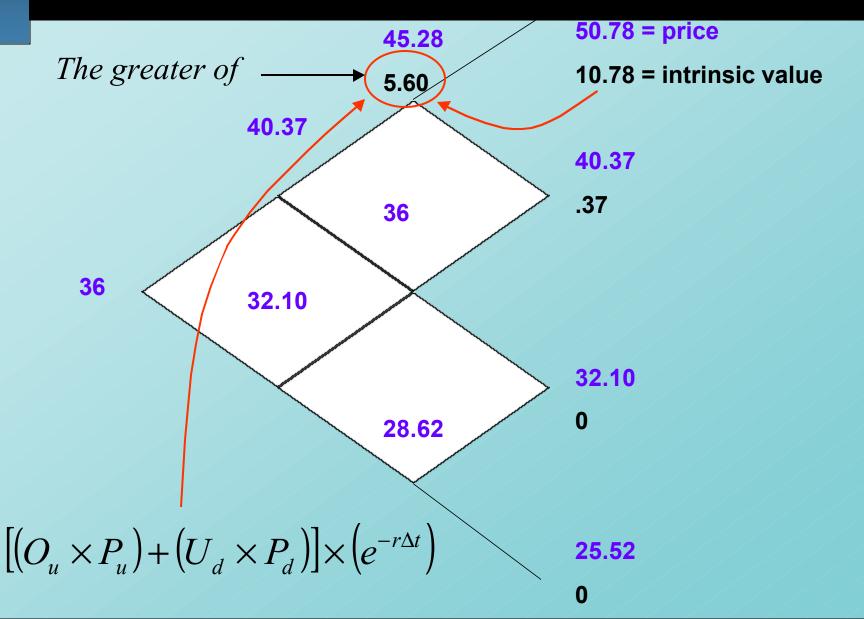

- Price = 36  $\sigma = .40$  t = 90/365  $\Delta$  t = 30/365 Strike = 40 r = 10%
- a = 1.0083 u = 1.1215 d = .8917 Pu = .5075Pd = .4925

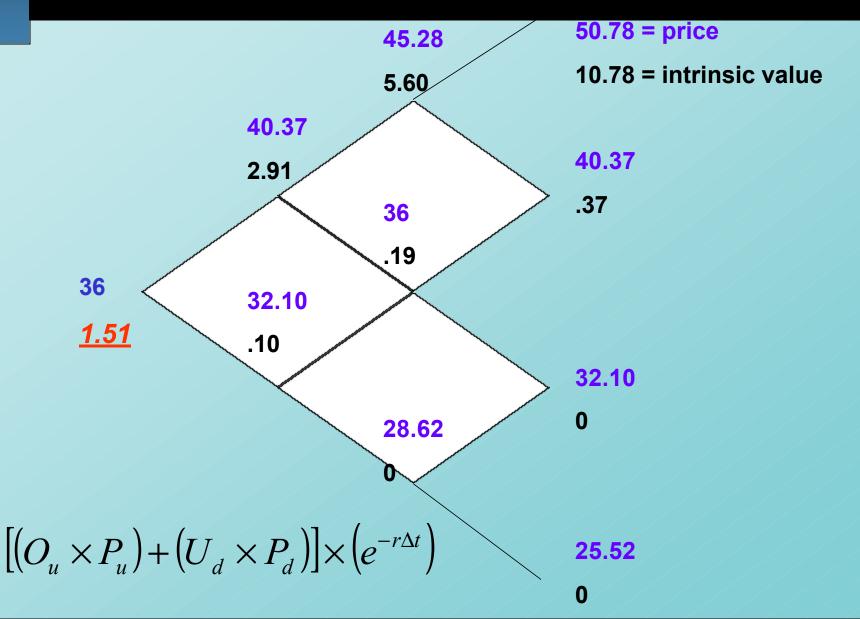

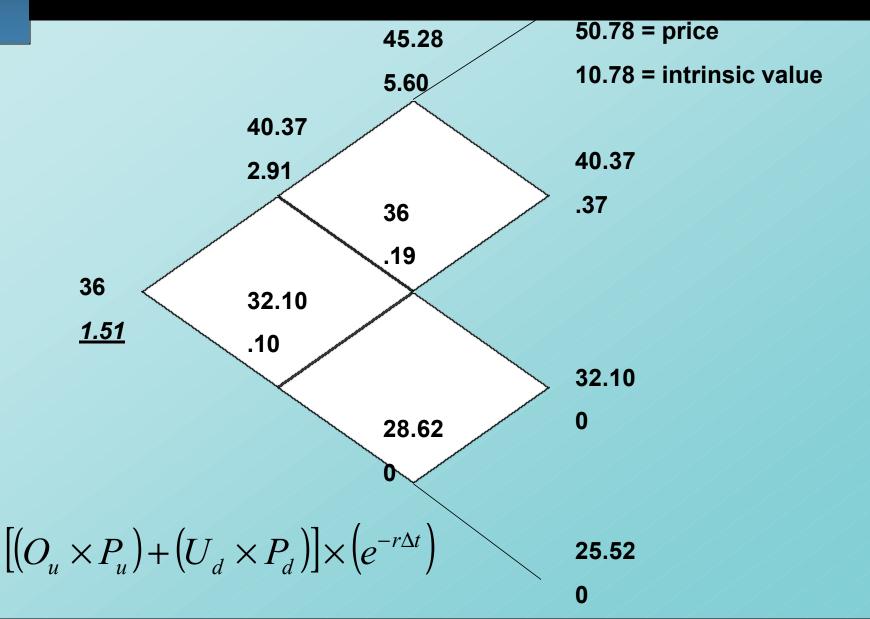

## **Binomial vs. Black Scholes**

Expanding the binomial model to allow more possible price changes

(2 outcomes)

1 step

(3 outcomes)

2 steps

4 steps (5 outcomes)

etc. etc.

## **Binomial vs. Black Scholes**

### How estimated call price changes as number of binomial steps increases

No. of steps	<b>Estimated value</b>
1	48.1
2	41.0
3	42.1
5	41.8
10	41.4
50	40.3
100	40.6
Black-Scholes	40.5

#### **Principles of Corporate Finance**

**Brealey and Myers** 

**Sixth Edition** 

### Warrants and Convertibles

# **Chapter 22**

# **Topics Covered**

- What is a Warrant?
- What is a Convertible Bond?
- The Difference Between Warrants and Convertibles
- Why do Companies Issue Warrants and Convertibles?

## Warrant Value

### **Example:** BJ Services warrants, January 1999 Exercise price

Warrant price \$ 9 \$16 Share price

Warrant price at maturity

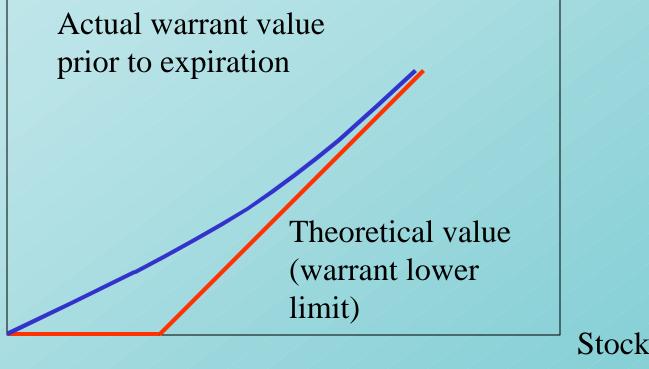

\$ 15

**BJ** Services share price

## Warrant Value vs. Stock Price

Value of warrant

Exercise price = \$15

Stock price

- United glue has just issued \$2 million package of debt and warrants. Using the following data, calculate the warrant value.
- $\clubsuit$  # shares outstanding = 1 mil
- **Current stock price =** \$12
- $\bigcirc$  Number of shares issued per share outstanding = .10
- $\bigcirc$  Total number of warrants issued = 100,000
- **\bigcirc** Exercise price of warrants = \$10
- **\bigcirc** Time to expiration of warrants = 4 years
- $\bigcirc$  Annualized standard deviation of stock daily returns = .40
- **\bigcirc** Rate of return = 10 percent

 United glue has just issued \$2 million package of debt and warrants. Using the following data, calculate the warrant value.

Cost of warrants = total financing - value of loans w/o warrants 500,000 = 2,000,000 - 1,500,000 $\$5 = \frac{500,000}{100,000}$ Cost of each warrant

 United glue has just issued \$2 million package of debt and warrants. Using the following data, calculate the warrant value.

 $(d_1) = 1.104$   $(d_2) = .304$ 

 $N(d_1) = .865$   $N(d_2) = .620$ 

• United glue has just issued \$2 million package of debt and warrants. Using the following data, calculate the warrant value.

### Warrant = 12[.865] - [.620]{10/1.1<sup>4</sup>] = \$6.15

- United glue has just issued \$2 million package of debt and warrants. Using the following data, calculate the warrant value.
- Value of warrant with dilution

Current equity value of<br/>alternative firm= V =Value of United's<br/>total assets- value of loans

V = 18 - 5.5 = \$12.5 million

- United glue has just issued \$2 million package of debt and warrants. Using the following data, calculate the warrant value.
- Value of warrant with dilution

Current share price of alternative firm  $=\frac{V}{N}=\frac{12.5 \text{ million}}{1 \text{ million}}=\$12.50$ 

Black Scholes formula gives value = \$6.64

- United glue has just issued \$2 million package of debt and warrants. Using the following data, calculate the warrant value.
- Value of warrant with dilution

 $\frac{1}{1+q}$  × value of call on alternative firm

 $\frac{1}{1.10} \times 6.64 = \$6.03$ 

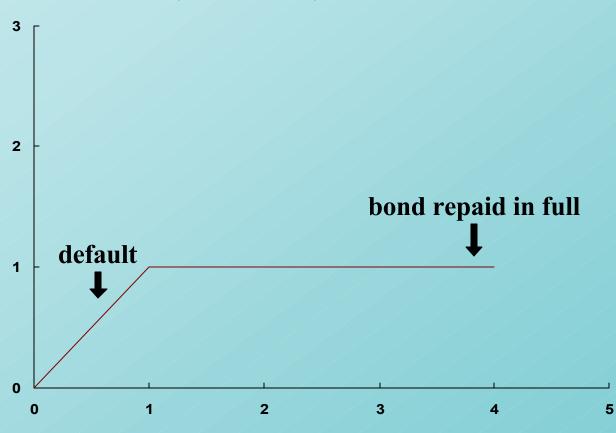

### ALZA

- → 5% Convertible 2006
- → Convertible into 26.2 shares
- → Conversion ratio 26.2
- → Conversion price = 1000/26.2 = \$38.17
- → Market price of shares = \$28

### ALZA

- → 5% Convertible 2006
- → Convertible into 26.2 shares
- → Conversion ratio 26.2
- → Conversion price = 1000/26.2 = \$38.17
- $\rightarrow$  Market price of shares = \$28
- Lower bound of value
  - → Bond value
  - → Conversion value = 26.2 x 28 = 733.60

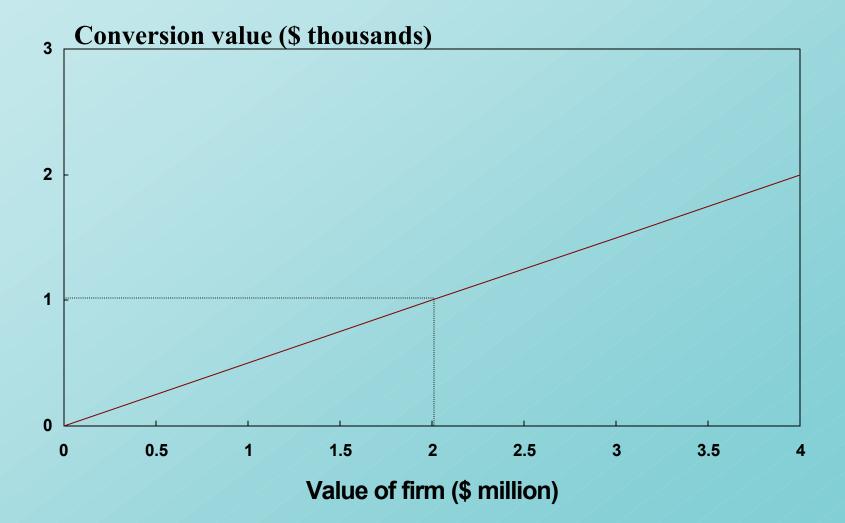

How bond value varies with firm value at maturity.

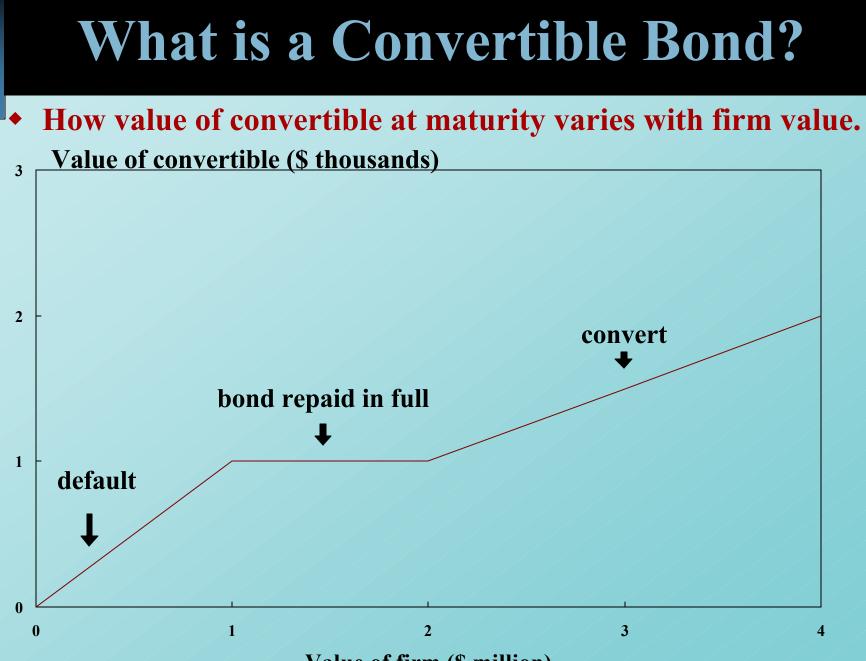

**Bond value (\$ thousands)** 

Value of firm (\$ million)

How conversion value at maturity varies with firm value.

Value of firm (\$ million)

#### **Principles of Corporate Finance**

**Brealey and Myers** 

**Sixth Edition** 

## **Chapter 23**

# **Topics Covered**

- The Classical Theory of Interest
- The Term Structure and YTM
- Duration and Volatility
- Explaining the Term Structure
- Allowing for the Risk of Default

Classical Theory of Interest Rates (Economics) developed by Irving Fisher

Classical Theory of Interest Rates (Economics)developed by Irving Fisher

Nominal Interest Rate = The rate you actually pay when you borrow money.

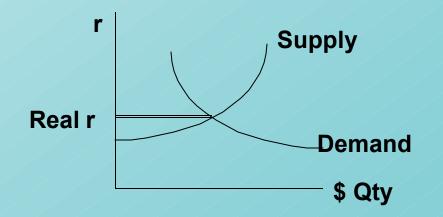

### **Debt & Interest Rates**

Classical Theory of Interest Rates (Economics)

developed by Irving Fisher

Nominal Interest Rate = The rate you actually pay when you borrow money.

Real Interest Rate = The theoretical rate you pay when you borrow money, as determined by supply and demand.

## **Debt & Interest Rates**

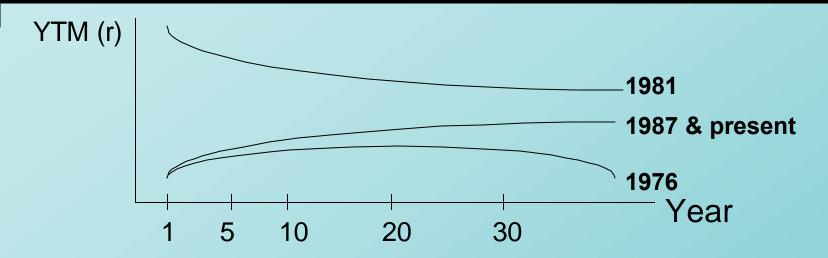

Nominal r = Real r + expected inflation

Real r is theoretically somewhat stable

Inflation is a large variable

- Q: Why do we care?
- A: This theory allows us to understand the Term Structure of Interest Rates.
- Q: So What?
- A: The Term Structure tells us the cost of debt.

### **Term Structure**

<u>Spot Rate</u> - The actual interest rate today (t=0)

<u>Forward Rate</u> - The interest rate, fixed today, on a loan made in the future at a fixed time.

Future Rate - The spot rate that is expected in the future.

<u>Yield To Maturity (YTM)</u> - The IRR on an interest bearing instrument.

## Debt & Risk

Example (Bond 1) Calculate the duration of our 10.5% bond @ 8.5% YTM

Year CF PV@YTM % of Total PV % x Year

# Debt & Risk

Example (Bond 1) Calculate the duration of our 10.5% bond @ 8.5% YTM

<u>Year</u>	<u>CF</u>	<u>PV@YTM</u>	<u>% of Total PV</u>	<u>% x Year</u>
1	105			
2	105			
3	105			
4	105			
5	1105			

## Debt & Risk

Example (Bond 1)

Calculate the duration of our 10.5% bond @ 8.5% YTM

<u>Year</u>	<u>CF</u>	<u>PV@YTM</u>	% of Total PV	<u>% x Year</u>
1	105	96.77		
2	105	89.19		
3	105	82.21		
4	105	75.77		
5	1105	<u>734.88</u>		
		<u>1078.82</u>		

#### Example (Bond 1)

Calculate the duration of our 10.5% bond @ 8.5% YTM

<u>Year</u>	<u>CF</u>	<u>PV@YTM</u>	% of Total PV	<u>% x Year</u>
1	105	96.77	.090	
2	105	89.19	.083	
3	105	82.21	.076	
4	105	75.77	.070	
5	1105	<u>734.88</u>	<u>.681</u>	
		<u>1078.82</u>	<u>1.00</u>	

#### Example (Bond 1)

Calculate the duration of our 10.5% bond @ 8.5% YTM

<u>Year</u>	<u>CF</u>	<u>PV@YTM</u>	% of Total PV	<u>% x Year</u>
1	105	96.77	.090	0.090
2	105	89.19	.083	0.164
3	105	82.21	.076	0.227
4	105	75.77	.070	0.279
5	1105	<u>734.88</u>	<u>.681</u>	<u>3.406</u>
		<u>1078.82</u>	<u>1.00</u>	4.166 Duration

Π

Example (Bond 2)
Given a 5 year, 9.0%, \$1000 bond, with a 8.5% YTM, what is this bond's duration?

Year CF PV@YTM % of Total PV %

<u>% x Year</u>

Example (Bond 2) Given a 5 year, 9.0%, \$1000 bond, with a 8.5% YTM, what is this bond's duration? Year <u>CF</u> <u>PV@YTM</u> % of Total PV <u>% x Year</u> 

Example (Bond 2)Given a 5 year, 9.0%, \$1000 bond, with a 8.5% YTM, what is this bond's duration?

- Year CF PV@YTM % of Total PV % x Year
- 1 90 82.95
- 2 90 76.45
- 3 90 70.46
- 4 90 64.94
- 5 1090 <u>724.90</u> <u>1019.70</u>

Example (Bond 2)Given a 5 year, 9.0%, \$1000 bond, with a 8.5% YTM, what is this bond's duration?

Yea	<u>CF</u>	<u>PV@YTM</u>	<u>% of Total PV</u>	<u>% x Year</u>
1	90	82.95	.081	
2	90	76.45	.075	
3	90	70.46	.069	
4	90	64.94	.064	
5	1090	<u>724.90</u>	<u>.711</u>	
		<u>1019.70</u>	<u>1.00</u>	

Example (Bond 2)

Given a 5 year, 9.0%, \$1000 bond, with a 8.5% YTM, what is this bond's duration?

<u>Yea</u>	<u>r CF</u>	<u>PV@YTM</u>	% of Total PV	<u>% x Year</u>
1	90	82.95	.081	0.081
2	90	76.45	.075	0.150
3	90	70.46	.069	0.207
4	90	64.94	.064	0.256
5	1090	<u>724.90</u>	<u>.711</u>	<u>3.555</u>
		<u>1019.70</u>	<u>1.00</u>	4.249 Duration

## **Term Structure**

#### What Determines the Shape of the TS?

- 1 Unbiased Expectations Theory
- 2 Liquidity Premium Theory
- 3 Market Segmentation Hypothesis

#### Term Structure & Capital Budgeting

- CF should be discounted using Term Structure info.
- Since the spot rate incorporates all forward rates, then you should use the spot rate that equals the term of your project.
- If you believe inother theories take advantage of the arbitrage.

# Yield To Maturity

- All interest bearing instruments are priced to fit the term structure.
- This is accomplished by modifying the asset price.
- The modified price creates a <u>New Yield</u>, which fits the Term Structure.
- The new yield is called the Yield To Maturity (YTM).

## **Yield to Maturity**

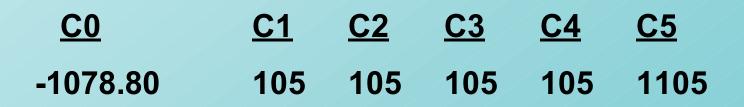

#### Example

A \$1000 treasury bond expires in 5 years. It pays a coupon rate of 10.5%. If the market price of this bond is 107-88, what is the YTM?

## Yield to Maturity

#### Example

A \$1000 treasury bond expires in 5 years. It pays a coupon rate of 10.5%. If the market price of this bond is 107-88, what is the YTM?

Calculate IRR = 8.5%

# Default, Premiums & Ratings

The risk of default changes the price of a bond and the YTM.

#### **Book Example**

We have a 9% 1 year bond. The built in price is \$1000. But, there is a 20% chance the company will go into bankruptcy and not be able to pay. What is the bond's value?

**A**:

## Default, Premiums & Ratings

#### **Book Example**

We have a 9% 1 year bond. The built in price is \$1000. But, there is a 20% chance the company will go into bankruptcy and not be able to pay. What is the bond's value?

A: <u>Bond Value</u>	<u>Prob</u>		
1090	.80	=	872.00
0	.20	=	<u> </u>
$Value = \frac{872}{1.09} = \$$ $YTM = \frac{1090}{800} = \$$			<u>872.00=expected CF</u>

## Default, Premiums & Ratings

Conversely - If on top of default risk, investors require an additional 2 percent market risk premium, the price and YTM is as follows:

$$Value = \frac{872}{1.11} = \$785.59$$
$$YTM = \frac{1090}{785.59} = 38.8\%$$

#### **Principles of Corporate Finance**

**Brealey and Myers** 

**Sixth Edition** 

#### • The Many Different Kinds of Debt

## **Chapter 24**

- Domestic Bonds and International Bonds
- The Bond Contract
- Security and Seniority Asset-Backed Securities
- Repayment Provisions
- Restrictive Covenants
- Private Placements and Project Finance
- Innovation in the Bond Market

# **Bond Terminology**

- Foreign bonds Bonds that are sold to local investors in another country's bond market.
- Yankee bond- a bond sold publicly by a foreign company in the United States.
- Sumari a bond sold by a foreign firm in Japan.
- Eurobond market wind European and American multinationals were forced to tap into international markets for capital.

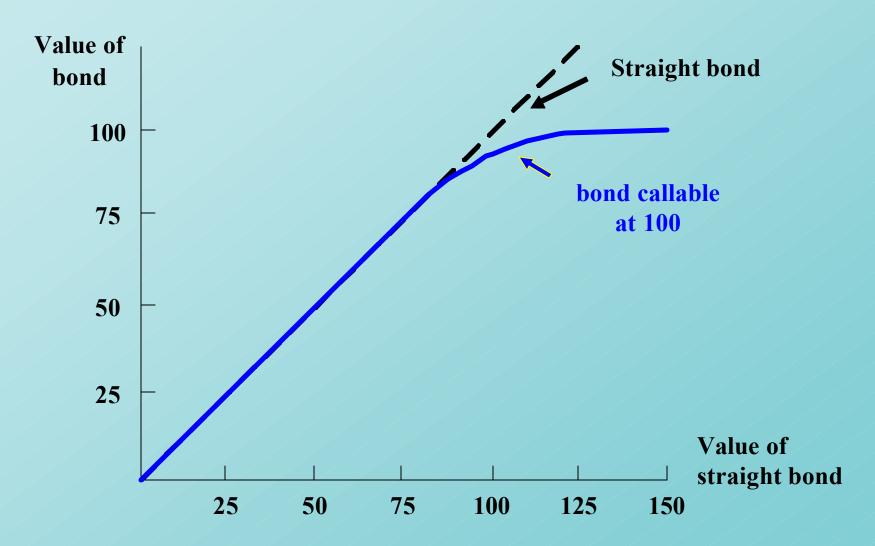

- Indenture or trust deed the bond agreement between the borrower and a trust company.
- Registered bond a bond in which the Company's records show ownership and interest and principle are paid directly to each owner.
- Bearer bonds the bond holder must send in coupons to claim interest and must send a certificate to claim the final payment of principle.

# **Bond Terminology**

- Accrued interest the amount of accumulated interest since the last coupon payment
- Debentures long-term unsecured issues on debt
- Mortgage bonds long-term secured debt often containing a claim against a specific building or property
- Asset-backed securities the sale of cash flows derived directly from a specific set of bundled assets

- Sinking fund a fund established to retired debt before maturity.
- Callable bond a bond that may be repurchased by a the firm before maturity at a specified call price.
- Defeasance a method of retiring corporate debt involving the creation of a trust funded with treasury bonds.

## Straight Bond vs. Callable Bond

- Restrictive covenants Limitations set by bondholders on the actions of the Corporation.
- Negative Pledge Clause the processing of giving unsecured debentures equal protection and when assets are mortgaged.
- Poison Put a clause that obliges the borrower to repay the bond if a large quantity of stock is bought by single investor, which causes the firms bonds to beat down rated.

# **Bond Terminology**

 Pay in kind (PIK) - a bond that makes regular interest payments, but in the early years of the bonds life the issuer can choose to pay interest in the form of either cash or more bonds with an equivalent face value.

### Covenants

- Debt ratios:
  - → Senior debt limits senior borrowing
  - → Junior debt limits senior & junior borrowing
- Security:
  - → Negative pledge
- Dividends
- Event risk
- Positive covenants:
  - → Working capital
  - → Net worth

## **Event Risk: An Example**

October 1993 Marriott spun off its hotel management business worth 80% of its value.

Before the spin-off, Marriott's long-term book debt ratio was 2891/3644 = 79%. Almost all the debt remained with the parent (renamed Host Marriott), whose debt ratio therefore rose to 93%.

Marriott's stock price rose 13.8% and its bond prices declined by up to 30%.

**Bondholders sued and Marriott modified its spinoff plan.** 

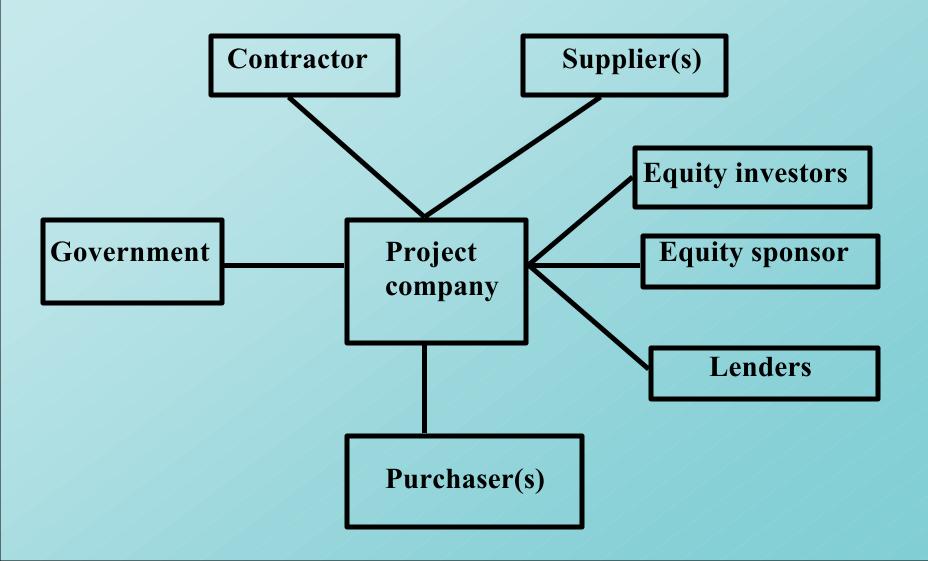

## **Project Finance**

1. Project is set up as a separate company.

2. A major proportion of equity is held by project manager or contractor, so provision of finance and management are linked.

3. The company is highly levered.

## **Parties In Project Finance**

### **Risk Allocation**

Risk	Shifted to:	Contract
Completion/ continuing management	Sponsor	Management contract/ completion gtees / working capital maintenance
<b>Construction cost</b>	Contractor	Turnkey contract/ fixed price/ delay penalties
Raw materials	Supplier(s)	Long-term contract/ indexed prices/ supply or pay
Revenues	Purchaser(s)	Long-term contract/ indexed to costs/ take or pay/ throughput agreements/ tolling contract
<b>Concession/regulation</b>	Government	Concession agreement/ provision of supporting infrastructure
Currency convertibility	Government	Gtees or comfort letters/ hard currency paid to offshore escrow account

#### **Principles of Corporate Finance**

**Brealey and Myers** 

**Sixth Edition** 

## **Chapter 25**

# **Topics Covered**

- What is a Lease?
- Why Lease?
- Operating Leases
- Valuing Financial Leases
- When Do Financial Leases Pay?

## Lease Terms

- Operating Leases
- Financial Leases
  - → Rental Lease
  - → Net lease
  - → Direct lease
  - → Leveraged lease

## Why Lease?

- Sensible Reasons for Leasing
  - → Short-term leases are convenient
  - → Cancellation options are valuable
  - → Maintenance is provided
  - → Standardization leads to low costs
  - → Tax shields can be used
  - → Avoiding the alternative minimum tax

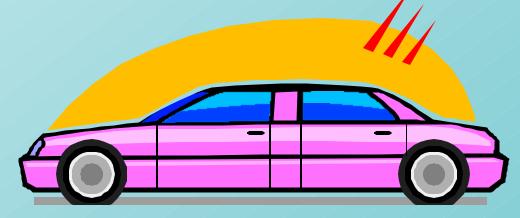

- Dubious Reasons for Leasing
  - → Leasing avoids capital expenditure controls
  - → Leasing preserves capital
  - → Leases may be off balance sheet financing
  - → Leasing effects book income

## **Operating Lease**

#### Example

Acme Limo has a client who will sign a lease for 7 years, with lease payments due at the start of each year. The following table shows the NPV of the limo if Acme purchases the new limo for \$75,000 and leases it our for 7 years.

## **Operating Lease**

#### **Example - cont**

Acme Limo has a client who will sign a lease for 7 years, with lease payments due at the start of each year. The following table shows the NPV of the limo if Acme purchases the new limo for \$75,000 and leases it our for 7 years.

	Year						
	0	1	2	3	4	5	6
Initial cost	-75						
Maintenance, insurance, selling,	-12	-12	-12	-12	-12	-12	-12
and administrative costs							
Tax shield on costs	4.2	4.2	4.2	4.2	4.2	4.2	4.2
Depreciation tax shield	0	5.25	8.4	5.04	3.02	3.02	1.51
Total	-82.8	-2.55	0.6	-2.76	-4.78	-4.78	-6.29
NPV @ 7% = - \$98.15

Тах	-9.16	-9.16	-9.16	-9.16	-9.16	-9.16	-9.16
Break even rent after-tax	17.02	17.02	17.02	17.02	17.02	17.02	17.02
NPV @ 7% = - \$98.15							

## **Financial Leases**

#### Example

Greymore Bus Lines is considering a lease. Your operating manager wants to buy a new bus for \$100,000. The bus has an 8 year life. The bus saleswoman says she will lease Greymore the bus for 8 years at \$16,900 per year, but Greymore assumes all operating and maintenance costs.

Should Greymore buy or lease the bus?

#### Example - cont

Greymore Bus Lines is considering a lease. Your operating manager wants to buy a new bus for \$100,000. The bus has an 8 year life. The bus saleswoman says she will lease Greymore the bus for 8 years at \$16,900 per year, but Greymore assumes all operating and maintenance costs. Should Greymore buy or lease the bus?

#### Cash flow consequences of the lease contract to Greymore

	Year							
	0	1	2	3	4	5	6	7
Cost of new bus	100.00							
Lost Depr tax shield		(7.00)	(11.20)	(6.72)	(4.03)	(4.03)	(2.02)	-
Lease payment	(16.90)	(16.90)	(16.90)	(16.90)	(16.90)	(16.90)	(16.90)	(16.90)
Tax shield of lease	5.92	5.92	5.92	5.92	5.92	5.92	5.92	5.92
Cash flow of lease	89.02	(17.98)	(22.18)	(17.70)	(15.01)	(15.01)	(13.00)	(10.98)

#### Example - cont

Greymore Bus Lines is considering a lease. Your operating manager wants to buy a new bus for \$100,000. The bus has an 8 year life. The bus saleswoman says she will lease Greymore the bus for 8 years at \$16,900 per year, but Greymore assumes all operating and maintenance costs. Should Greymore buy or lease the bus?

Cash flow consequences of the lease contract to Greymore:

- •Greymore saves the \$100,000 cost of the bus.
- •Loss of depreciation benefit of owning the bus.
- •\$16,900 lease payment is due at the start of each year.
- •Lease payments are tax deductible.

#### Example - cont

Greymore Bus Lines Balance Sheet without lease

Greymore Bus Lines (figures in \$1,000s)						
Bus	10	100	Loan secured by bus			
All other assets	1000	450	Other loans			
-		550	Equity			
<b>Toital Assets</b>	1100	1100	Total liabilities			

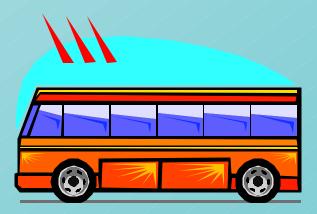

#### Equivalent lease balance sheet

Greymore Bus Lines (figures in \$1,000s)						
Bus	10	100	Financial lease			
All other assets	1000	450	Other loans			
		550	Equity			
Toital Assets	1100	1100	Total liabilities			

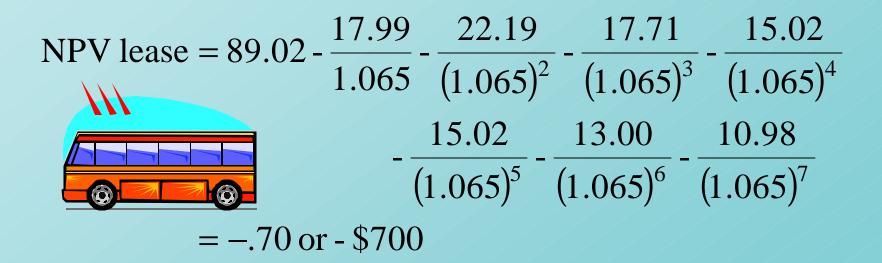

#### Example - cont

Greymore Bus Lines can borrow at 10%, thus the value of the lease should be discounted at 6.5% or .10 x (1-.35). The result will tell us if Greymore should lease or buy the bus.

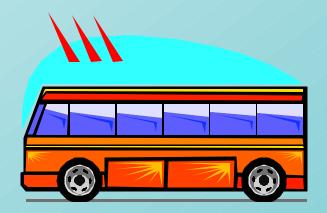

#### Example - cont

Greymore Bus Lines can borrow at 10%, thus the value of the lease should be discounted at 6.5% or  $.10 \times (1-.35)$ . The result will tell us if Greymore should lease or buy the bus.

#### Example - cont

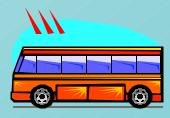

Greymore Bus Lines lease cash flows can also be thought of as loan equivalent cash flows.

Example - cont

Greymore Bus Lines lease cash flows can also be thought of as loan equivalent cash flows.

				Year				
	0	1	2	3	4	5	6	7
Amount borrowed								
at year end	89.72	77.56	60.42	46.64	34.66	21.89	10.31	0.00
Interest paid @ 10%		-8.97	-7.76	-6.04	-4.66	-3.47	-2.19	-1.03
Tax shield @ 35%		3.14	2.71	2.11	1.63	1.21	0.77	0.36
Interest paid after tax		-5.83	-5.04	-3.93	-3.03	-2.25	-1.42	-0.67
Principal repaid		-12.15	-17.14	-13.78	-11.99	-12.76	-11.58	-10.31
Net cash flow of								
equivalent loan	89.72	-17.99	-22.19	-17.71	-15.02	-15.02	-13.00	-10.98

#### Example - cont

The Greymore Bus Lines lease cash flows can also be treated as a favorable financing alternative and valued using APV.

APV = NPV of project NPV of lease APV = -5,000 + 8,000 = \$3,000

### **Principles of Corporate Finance**

**Brealey and Myers** 

**Sixth Edition** 

## **Chapter 26**

# **Topics Covered**

### Insurance

- Hedging With Futures
- Speculating and Margin
- SWAPS

- Most businesses face the possibility of a hazard that can bankrupt the company in an instant.
- These risks are neither financial or business and can not be diversified.
- The cost and risk of a loss due to a hazard, however, can be shared by others who share the same risk.

### **Example**

An offshore oil platform is valued at \$1 billion. Expert meteorologist reports indicate that a 1 in 10,000 chance exists that the platform may be destroyed by a storm over the course of the next year.

How can the cost of this hazard be shared?

#### <u>Example - cont.</u>

An offshore oil platform is valued at \$1 billion. Expert meteorologist reports indicate that a 1 in 10,000 chance exists that the platform may be destroyed by a storm over the course of the next year.

How can the cost of this hazard be shared?

#### Answer:

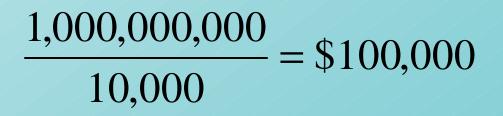

A large number of companies with similar risks can each contribute pay into a fund that is set aside to pay the cost should a member of this risk sharing group experience the 1 in 10,000 loss. The other 9,999 firms may not experience a loss, but also avoided the risk of not being compensated should a loss have occurred.

#### Example - cont.

An offshore oil platform is valued at \$1 billion. Expert meteorologist reports indicate that a 1 in 10,000 chance exists that the platform may be destroyed by a storm over the course of the next year.

What would the cost to each group member be for this protection?

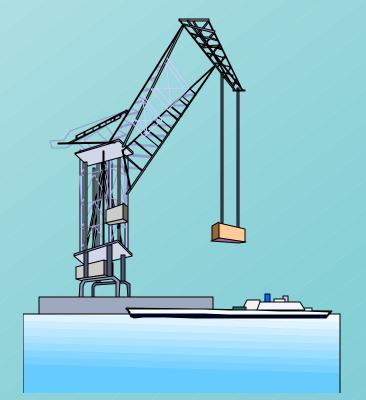

Answer:

 Why would an insurance company not offer a policy on this oil platform for \$100,000?

→ Administrative costs
→ Adverse selection
→ Moral hazard

The loss of an oil platform by a storm may be 1 in 10,000. The risk, however, is larger for an insurance company since all the platforms in the same area may be insured, thus if a storm damages one in may damage all in the same area. The result is a much larger risk to the insurer.

 Catastrophe Bonds - (CAT Bonds) Allow insurers to transfer their risk to bond holders by selling bonds whose cash flow payments depend on the level of insurable losses NOT occurring.

# Hedging

### **Business has risk**

Business Risk - variable costs Financial Risk - Interest rate changes

Goal - Eliminate risk

HOW? Hedging & Futures Contracts

# Hedging

- <u>Ex -</u> Kellogg produces cereal. A major component and cost factor is sugar.
- Forecasted income & sales volume is set by using a fixed selling price.
- Changes in cost can impact these forecasts.
- To fix your sugar costs, you would ideally like to purchase all your sugar today, since you like today's price, and made your forecasts based on it. But, you can not.
- You can, however, sign a contract to purchase sugar at various points in the future for a price negotiated today.
- This contract is called a "Futures Contract."
- This technique of managing your sugar costs is called "Hedging."

- 1- Spot Contract A contract for immediate sale & delivery of an asset.
- 2- Forward Contract A contract between two people for the delivery of an asset at a negotiated price on a set date in the future.
- 3- Futures Contract A contract similar to a forward contract, except there is an intermediary that creates a standardized contract. Thus, the two parties do not have to negotiate the terms of the contract.

The intermediary is the Commodity Clearing Corp (CCC). The CCC guarantees all trades & "provides" a secondary market for the speculation of Futures.

# **Types of Futures**

#### **Commodity Futures**

- -Sugar -Corn -OJ
- -Wheat-Soy beans -Pork bellies

#### **Financial Futures**

-Tbills-Yen-GNMA-Stocks-Eurodollars

#### **Index Futures**

- -S&P 500 -Value Line Index
- -Vanguard Index

## **Futures Contract Concepts**

Not an actual sale

Always a winner & a loser (unlike stocks)

K are "settled" every day. (Marked to Market)

Hedge - K used to eliminate risk by locking in prices

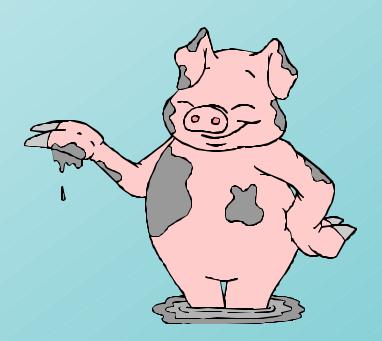

Speculation - K used to gamble

Margin - not a sale - post partial amount

Hog K = 30,000 lbs Tbill K = \$1.0 mil Value line Index K = \$index x 500

## Ex - Settlement & Speculate

**Example -** You are speculating in Hog Futures. You think that the Spot Price of hogs will rise in the future. Thus, you go Long on 10 Hog Futures. If the price drops .17 cents per pound (\$.0017) what is total change in your position?

## Ex - Settlement & Speculate

**Example -** You are speculating in Hog Futures. You think that the Spot Price of hogs will rise in the future. Thus, you go Long on 10 Hog Futures. If the price drops .17 cents per pound (\$.0017) what is total change in your position?

30,000 lbs x \$.0017 loss x 10 Ks = \$510.00 loss

Since you must settle your account every day, you must give your broker \$510.00

In June, farmer John Smith expects to harvest 10,000 bushels of corn during the month of August. In June, the September corn futures are selling for \$2.94 per bushel (1K = 5,000 bushels). Farmer Smith wishes to lock in this price.

Show the transactions if the Sept spot price drops to \$2.80.

In June, farmer John Smith expects to harvest 10,000 bushels of corn during the month of August. In June, the September corn futures are selling for \$2.94 per bushel (1K = 5,000 bushels). Farmer Smith wishes to lock in this price.

Show the transactions if the Sept spot price drops to \$2.80.

Revenue from Crop: 10,000 x 2.80	28,000
June: Short 2K @ 2.94 = 29,400	
Sept: Long 2K @ 2.80 = <u>28,000</u>	
Gain on Position	1,400
Total Revenue	<u>\$ 29,400</u>

In June, farmer John Smith expects to harvest 10,000 bushels of corn during the month of August. In June, the September corn futures are selling for \$2.94 per bushel (1K = 5,000 bushels). Farmer Smith wishes to lock in this price.

Show the transactions if the Sept spot price rises to \$3.05.

In June, farmer John Smith expects to harvest 10,000 bushels of corn during the month of August. In June, the September corn futures are selling for \$2.94 per bushel (1K = 5,000 bushels). Farmer Smith wishes to lock in this price.

Show the transactions if the Sept spot price rises to \$3.05.

Revenue from Crop: 10,000 x 3.05	30,500
June: Short 2K @ 2.94 = 29,400	
Sept: Long 2K @ 3.05 = <u>30,500</u>	
Loss on Position	( 1,100 )
Total Revenue	<u>\$ 29,400</u>

## **Commodity Speculation**

You have lived in NYC your whole life and are independently wealthy. You think you know everything there is to know about pork bellies (uncurred bacon) because your butler fixes it for you every morning. Because you have decided to go on a diet, you think the price will drop over the next few months. On the CME, each PB K is 38,000 lbs. Today, you decide to short three May Ks @ 44.00 cents per lbs. In Feb, the price rises to 48.5 cents and you decide to close your position. What is your gain/loss?

## **Commodity Speculation**

You have lived in NYC your whole life and are independently wealthy. You think you know everything there is to know about pork bellies (uncurred bacon) because your butler fixes it for you every morning. Because you have decided to go on a diet, you think the price will drop over the next few months. On the CME, each PB K is 38,000 lbs. Today, you decide to short three May Ks @ 44.00 cents per lbs. In Feb, the price rises to 48.5 cents and you decide to close your position. What is your gain/loss?

Nov: Short 3 May K  $(.4400 \times 38,000 \times 3) = +50,160$ 

- Feb: Long 3 May K (.4850 x 38,000 x 3) = -55,290
  - Loss of 10.23 % = -5,130

# Margin

- The amount (percentage) of a Futures
   Contract Value that must be on deposit with a broker.
- Since a Futures Contract is not an actual sale, you need only pay a fraction of the asset value to <u>open</u> a position = margin.
- CME margin requirements are 15%
- Thus, you can control \$100,000 of assets with only \$15,000.

# **Commodity Speculation** with margin

You have lived in NYC your whole life and are independently wealthy. Birth 1981

Definition - An agreement between two firms, in which each firm agrees to exchange the "interest rate characteristics" of two different financial instruments of identical principal

<u>Key points</u> Spread inefficiencies Same notation principle Only interest exchanged

- "Plain Vanilla Swap" (generic swap)
- fixed rate payer
- floating rate payer
- counterparties
- settlement date
- trade date
- effective date
- terms

#### Swap Gain = fixed spread - floating spread

#### example (vanilla/annually settled)

	XYZ	ABC
fixed rate	10%	11.5%
floating rate	libor $+.25$	libor $+.50$

Q: if libor = 7%, what swap can be made 7 what is the profit (assume \$1mil face value loans)

#### A:

XYZ borrows \$1mil @ 10% fixed ABC borrows \$1mil @ 7.5% floating XYZ pays floating @ 7.25% ABC pays fixed @ 10.50%

#### <u>example - cont.</u>

Benefit to XYZ floating +7.25 -7.25 <u>fixed +10.50 -10.00</u> Net gain Net position 0 <u>+.50</u> +.50%

Benefit ABC floating +7.25 - 7.50 <u>fixed -10.50 + 11.50</u> net gain Net Position -.25 <u>+1.00</u> +.75%

#### example - cont.

<u>Settlement date</u> ABC pmt 10.50 x 1mil <u>XYZ pmt 7.25 x 1mil</u> net cash pmt by ABC

= 105,000= 72,500= 32,500

if libor rises to 9% <u>settlement date</u> ABC pmt 10.50 x 1mil <u>XYZ pmt 9.25 x 1mil</u> net cash pmt by ABC

= 105,000= 92,500= 12,500

- transactions
- rarely done direct
- banks = middleman
- bank profit = part of "swap gain"

#### example - same continued

XYZ & ABC go to bank separately XYZ term = SWAP floating @ libor + .25 for fixed @ 10.50 ABC terms = swap floating libor + .25 for fixed 10.75

#### <u>example - cont.</u>

settlement date - XYZ	
Bank pmt 10.50 x 1mil	= 105,000
XYZ pmt 7.25 x 1mil	= 72,500
net Bank pmt to XYZ	= 32,500

settlement date - ABCBank pmt 7.25 x 1mil= 72,500ABC pmt 10.75 x 1mil= 107,500net ABC pmt to bank= 35,000

bank "swap gain" = +35,000 - 32,500 = +2,500

#### example - cont.

benefit to XYZ	
floating 7.25 -	7.25 = 0
fixed	10.50 - 10.00 = +.50

net gain .50

# benefit to ABCfloating 7.25-7.50 = -.25fixed-10.75 + 11.50 = +.75net gain .50

benefit to bankfloating +7.25 - 7.25 = 0fixed10.75 - 10.50 = +.25

net gain +.25

total benefit = 12,500 (same as w/o bank)

#### **Principles of Corporate Finance**

**Brealey and Myers** 

**Sixth Edition** 

#### Managing International Risk

#### **Chapter 27**

# **Topics Covered**

- Foreign Exchange Markets
- Some Basic Relationships
- Hedging Currency Risk
- Exchange Risk and International Investment Decisions

**Exchange Rate** - Amount of one currency needed to purchase one unit of another.

**Spot Rate of Exchange** - Exchange rate for an immediate transaction.

**Forward Exchange Rate** - Exchange rate for a forward transaction.

Forward Premiums and Forward Discounts **Example** - The yen spot price is 112.645 yen per dollar and the 6 month forward rate is 111.300 yen per dollar, what is the premium and discount relationship?

#### **Forward Premiums and Forward Discounts**

**Example** - The yen spot price is 112.645 yen per dollar and the 6 month forward rate is 111.300 yen per dollar, what is the premium and discount relationship?

 $\frac{\text{Forward Price - Spot Price}}{\text{Spot Price}} = \text{Premium or (-Discount)}$ 

 $4 \times \frac{112.645 - 111.300}{111.300} \times 100 = 4.8\%$ 

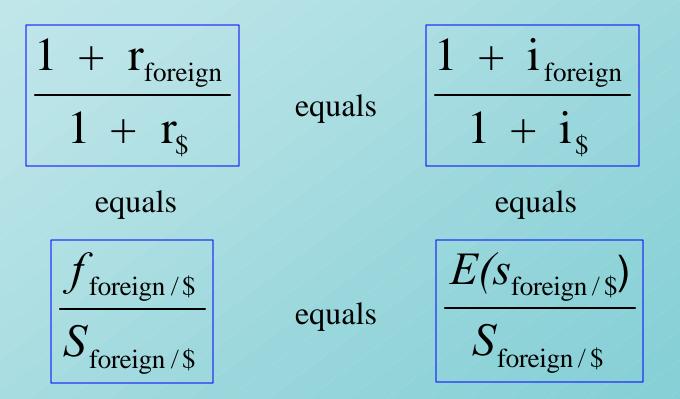

#### **Forward Premiums and Forward Discounts**

**Example** - The yen spot price is 112.645 yen per dollar and the 6 month forward rate is 111.300 yen per dollar, what is the premium and discount relationship?

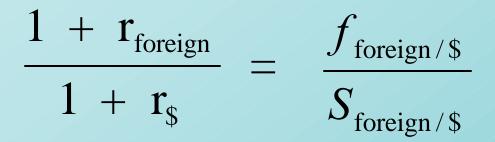

Answer - The dollar is selling at a 4.8% premium, relative to the yen. The yen is selling at a 4.8% discount, relative to the dollar.

¥

#### Basic Relationships

1) Interest Rate Parity Theory

• The ratio between the risk free interest rates in two different countries is equal to the ratio between the forward and spot exchange rates.

**Example** - You have the opportunity to invest \$1,000,000 for one year. All other things being equal, you have the opportunity to obtain a 1 year Japanese bond (in yen) @ 0.25 % or a 1 year US bond (in dollars) @ 5%. The spot rate is 112.645 yen:\$1 The 1 year forward rate is 107.495 yen:\$1

Which bond will you prefer and why?

Ignore transaction costs.

**Example** - You have the opportunity to invest \$1,000,000 for one year. All other things being equal, you have the opportunity to obtain a 1 year Japanese bond (in yen) @ 0.25 % or a 1 year US bond (in dollars) @ 5%. The spot rate is 112.645 yen:\$1 The 1 year forward rate is 107.495 yen:\$1

Which bond will you prefer and why? Ignore transaction costs.

Value of US bond =  $100,000 \times 1.05 = 105,000$ 

**Example** - You have the opportunity to invest \$1,000,000 for one year. All other things being equal, you have the opportunity to obtain a 1 year Japanese bond (in yen) @ 0.25 % or a 1 year US bond (in dollars) @ 5%. The spot rate is 112.645 yen:\$1 The 1 year forward rate is 107.495 yen:\$1

Which bond will you prefer and why? Ignore transaction costs

Value of US bond =  $100,000 \times 1.05 = 105,000$ 

Value of Japan bond = \$100,000 x 112.645 = 112,645,000 yen exchange

**Example** - You have the opportunity to invest \$1,000,000 for one year. All other things being equal, you have the opportunity to obtain a 1 year Japanese bond (in yen) @ 0.25 % or a 1 year US bond (in dollars) @ 5%. The spot rate is 112.645 yen:\$1 The 1 year forward rate is 107.495 yen:\$1

Which bond will you prefer and why? Ignore transaction costs

Value of US bond =  $100,000 \times 1.05 = 105,000$ 

Value of Japan bond = \$100,000 x 112.645 = 112,645,000 yen exchange 112,645,000 yen x 1.08 = 112,927,000 yen bond pmt

**Example** - You have the opportunity to invest \$1,000,000 for one year. All other things being equal, you have the opportunity to obtain a 1 year Japanese bond (in yen) @ 0.25 % or a 1 year US bond (in dollars) @ 5%. The spot rate is 112.645 yen:\$1 The 1 year forward rate is 107.495 yen:\$1

Which bond will you prefer and why? Ignore transaction costs

Value of US bond =  $100,000 \times 1.05 = 105,000$ 

Value of Japan bond = \$100,000 x 112.645 = 112,645,000 yen exchange

112,645,000 yen x 1.08 = 112,927,000 yen bond pmt

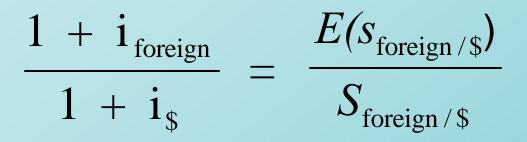

112,927,000 yen / 107.495 = **\$1,050,500** exchange

2) Expectations Theory of Exchange Rates

$$\frac{f_{\text{foreign/\$}}}{S_{\text{foreign/\$}}} = \frac{E(s_{\text{foreign/\$}})}{S_{\text{foreign/\$}}}$$

Theory that the expected spot exchange rate equals the forward rate.

#### 3) Purchasing Power Parity

The expected change in the spot rate equals the expected difference in inflation between the two countries.

#### Example

If inflation in the US is forecasted at 2.0% this year and Japan is forecasted to fall 2.5%, what do we know about the expected spot rate?

Given a spot rate of

112.645yen:\$1

Example - If inflation in the US is forecasted at 2.0% this year and Japan is forecasted to fall 2.5%, what do we know about the expected spot rate?

Given a spot rate of 112.645yen:\$1

$$\frac{1 + i_{\text{foreign}}}{1 + i_{\$}} = \frac{E(s_{\text{foreign/$\$}})}{S_{\text{foreign/$\$}}}$$

Example - If inflation in the US is forecasted at 2.0% this year and Japan is forecasted to fall 2.5%, what do we know about the expected spot rate?

Given a spot rate of 112.645yen:\$1

$$\frac{1 + i_{\text{foreign}}}{1 + i_{\$}} = \frac{E(s_{\text{foreign/$\$}})}{S_{\text{foreign/$\$}}}$$
$$\frac{1 - .025}{1 + .02} = \frac{E(s_{\text{foreign/$\$}})}{112.645}$$

Example - If inflation in the US is forecasted at 2.0% this year and Japan is forecasted to fall 2.5%, what do we know about the expected spot rate?

Given a spot rate of 112.645yen:\$1

$$\frac{1 + i_{\text{foreign}}}{1 + i_{\$}} = \frac{E(s_{\text{foreign/\$}})}{S_{\text{foreign/\$}}}$$
solve for Es
$$\frac{1 - .025}{1 + .02} = \frac{E(s_{\text{foreign/\$}})}{112.645}$$
Es = 107.68

#### 4) International Fisher effect

$$\frac{1 + r_{\text{foreign}}}{1 + r_{\$}} = \frac{1 + i_{\text{foreign}}}{1 + i_{\$}}$$

# The expected difference in inflation rates equals the difference in current interest rates.

#### Also called common real interest rates.

**Example** - The real interest rate in each country is about the same.

$$r(real) = \frac{1 + r_{\text{foreign}}}{1 + i_{\text{foreign}}} = \frac{1.0025}{.975} = .028$$
$$1 + r_{\text{s}} = 1.05$$

$$r(real) = \frac{1 + i_{\$}}{1 + i_{\$}} = \frac{1.05}{1.02} = .029$$

**Example -** Honda builds a new car in Japan for a cost + profit of 1,715,000 yen. At an exchange rate of 101.18:\$1 the car sells for \$16,950 in Baltimore. If the dollar rises in value, against the yen, to an exchange rate of 105:\$1, what will be the price of the car?

**Example -** Honda builds a new car in Japan for a cost + profit of 1,715,000 yen. At an exchange rate of 101.18:\$1 the car sells for \$16,950 in Baltimore. If the dollar rises in value, against the yen, to an exchange rate of 105:\$1, what will be the price of the car?

#### 1,715,000 = \$16,333105

**Example -** Honda builds a new car in Japan for a cost + profit of 1,715,000 yen. At an exchange rate of 101.18:\$1 the car sells for \$16,950 in Baltimore. If the dollar rises in value, against the yen, to an exchange rate of 105:\$1, what will be the price of the car?

#### 1,715,000 = \$16,333

105

Conversely, if the yen is trading at a forward discount, Japan will experience a decrease in purchasing power.

**Example** - Harley Davidson builds a motorcycle for a cost plus profit of \$12,000. At an exchange rate of 101.18:\$1, the motorcycle sells for 1,214,160 yen in Japan. If the dollar rises in value and the exchange rate is 105:\$1, what will the motorcycle cost in Japan?

**Example** - Harley Davidson builds a motorcycle for a cost plus profit of \$12,000. At an exchange rate of 101.18:\$1, the motorcycle sells for 1,214,160 yen in Japan. If the dollar rises in value and the exchange rate is 105:\$1, what will the motorcycle cost in Japan?

 $12,000 \times 105 = 1,260,000 \text{ yen} (3.78\% \text{ rise})$ 

 Currency Risk can be reduced by using various financial instruments.

 Currency forward contracts, futures contracts, and even options on these contracts are available to control the risk.

# **Capital Budgeting**

#### **Techniques**

- 1) Exchange to \$ and analyze.
- 2) Discount using foreign cash flows and interest rates, then exchange to \$.
- 3) Choose a currency standard (\$) and hedge all non dollar CF.

3.22

Dividend per share, dollars

## **Executive Paper**

#### **Executive Paper Sources and Uses of Funds (1999)**

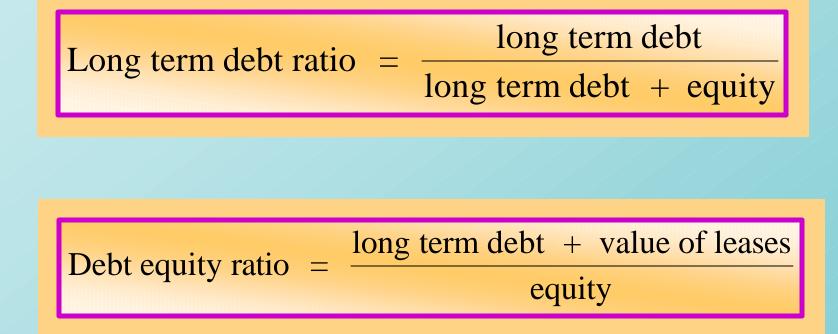

Sources:	<b>\$ millions</b>
Net Income	76.00
Depreciation	53.30
Operating cash flow	129.30
Borrowing	-
Stock issues	-
Total sources	129.30

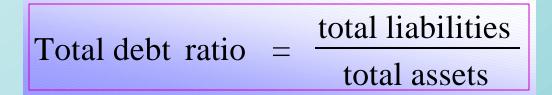

#### Uses:

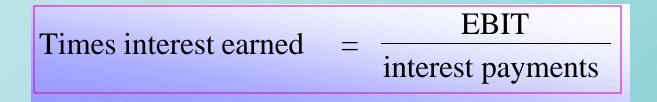

Increase in net working capital	13.50
Investment	70.20
Dividends	45.60
Total uses	129.30

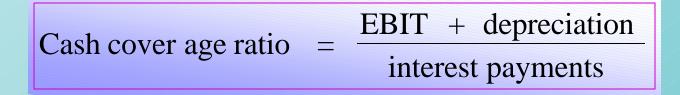

## **Leverage Ratios**

## **Leverage Ratios**

# **Liquidity Ratios**

Net working capital

to total assets ratio

Net working capital Total assets

 $Current ratio = \frac{current assets}{current liabilities}$ 

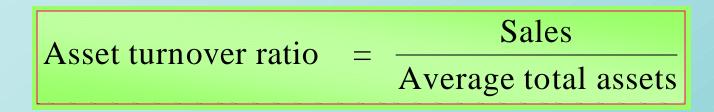

# **Liquidity Ratios**

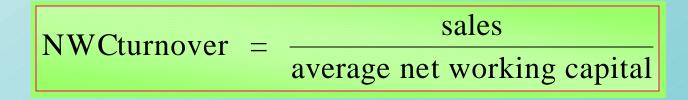

Quick ratio =  $\frac{\text{cash} + \text{marketable securities} + \text{receivables}}{\text{current liabilities}}$ 

$$Cash ratio = \frac{cash + marketable securities}{current liabilities}$$

Interval measure =		cash + marketable securities + receivables
	average daily expenditures from operations	

## **Efficiency Ratios**

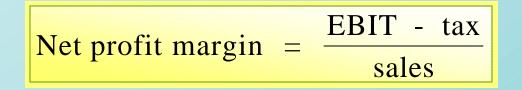

## **Efficiency Ratios**

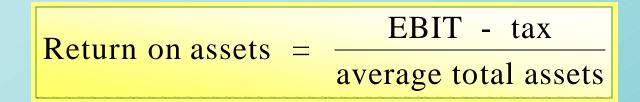

Inventory turnover ratio =  $\frac{\text{cost of goods sold}}{\text{average inventory}}$ 

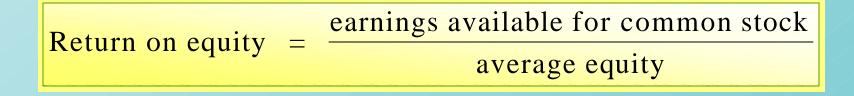

Days' sales in inventory =  $\frac{\text{average inventory}}{\text{cost of goods sold} / 365}$ 

Average collection period =  $\frac{\text{average receivables}}{\text{average daily sales}}$ 

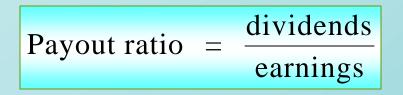

### **Profitability Ratios**

## **Profitability Ratios**

Plowback ratio =		earnings - dividends		
	_	earnings		
	=	1 - payout ratio		

Growth in equity from plowback =  $\frac{\text{earnings} - \text{dividends}}{\text{earnings}}$ 

### Market Value Ratios

PE Ratio = 
$$\frac{\text{stock price}}{\text{earnings per share}}$$

Forecasted PE ratio = 
$$\frac{P_0}{aveEPS_1}$$
 =  $\frac{Di v_1}{EPS_1} \times \frac{1}{r - g}$ 

Dividend yield = 
$$\frac{\text{dividend per share}}{\text{stock price}}$$

### **Market Value Ratios**

Price per share = 
$$P_0 = \frac{\text{Div}_1}{\text{r} - \text{g}}$$

stock price book value per share

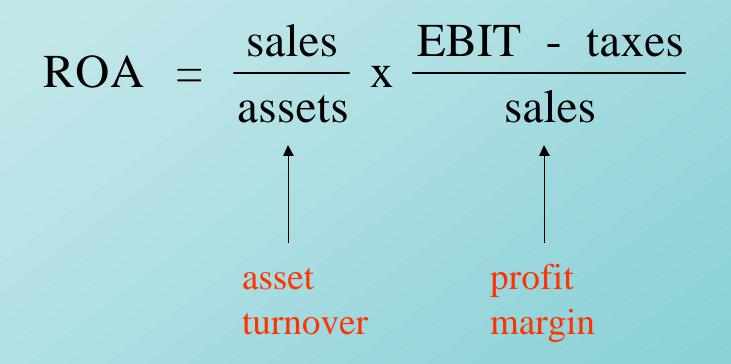

Tobins Q =  $\frac{\text{market value of assets}}{\text{estimated repleement cost}}$ 

 A breakdown of ROE and ROA into component ratios:

 $ROA = \frac{EBIT - taxes}{assets}$ 

ROE =  $\frac{\text{earnings available for common stock}}{\text{equity}}$ 

$$ROA = \frac{sales}{assets} \times \frac{EBIT - taxes}{sales}$$

#### **Principles of Corporate Finance**

**Brealey and Myers** 

**Sixth Edition** 

#### Short Term Financial Planning

## **Chapter 29**

# **Topics Covered**

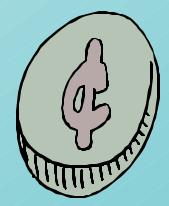

- Working Capital
- Links Between Long-Term and Short-Term Financing
- Tracing Changes in Cash and Working Capital
- Cash Budgeting
- A Short-Term Financing Plan

<u>Net Working Capital</u> - Current assets minus current liabilities. Often called working capital.

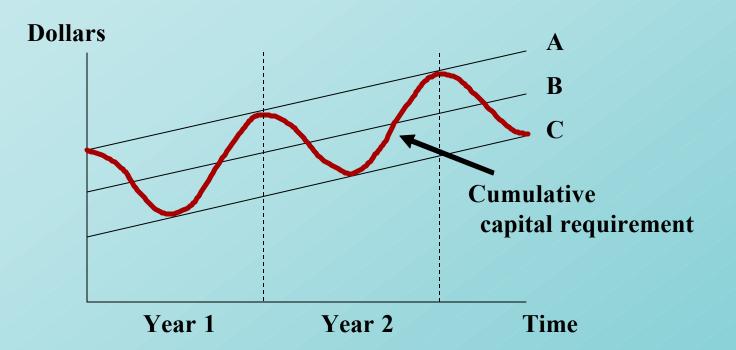

- <u>Cash Conversion Cycle</u> Period between firm's payment for materials and collection on its sales.
- <u>Carrying Costs</u> Costs of maintaining current assets, including opportunity cost of capital.

Shortage Costs - Costs incurred from shortages in

current assets.

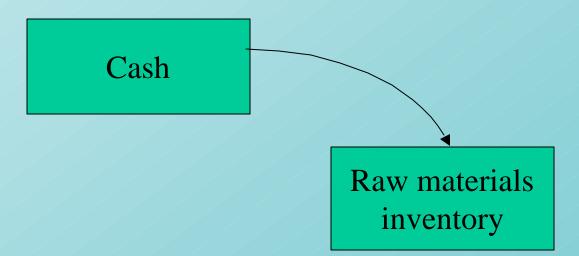

### Firm's Cumulative Capital Requirement

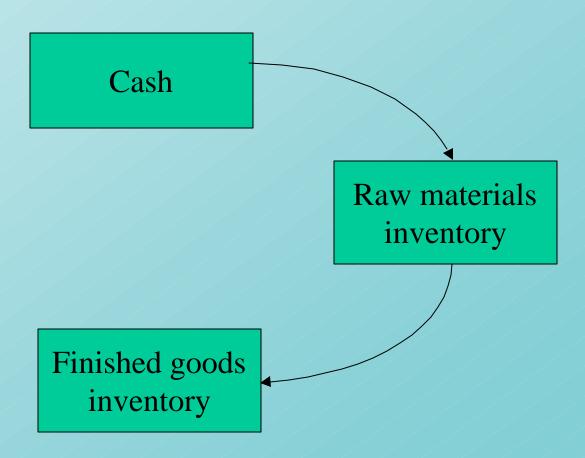

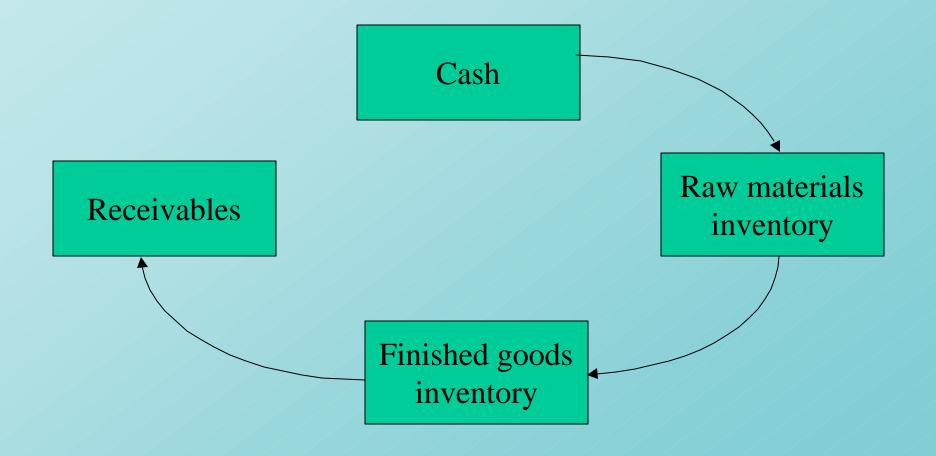

#### Lines A, B, and C show alternative amounts of long-term finance.

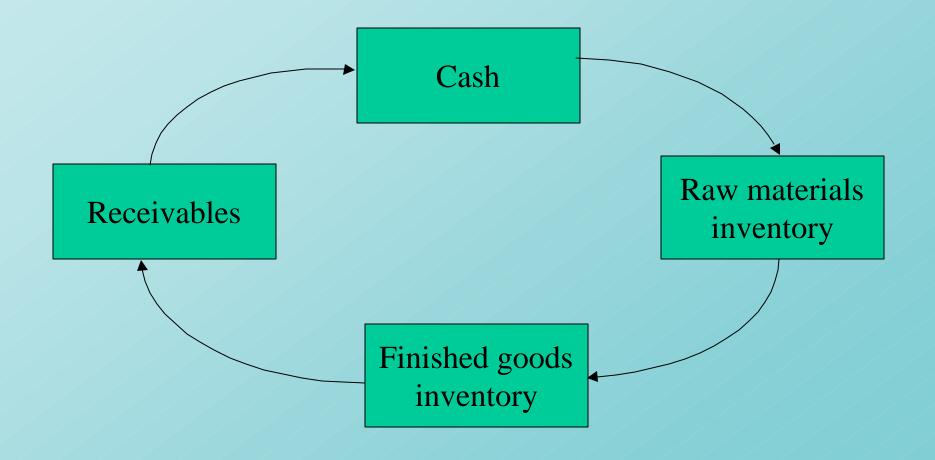

- Strategy A: A permanent cash surplusStrategy B: Short-term lender for part of year and borrower for remainder
- **Strategy C: A permanent short-term borrower**

## Changes in Cash & W.C.

#### **Example** - Dynamic Mattress Company

Assets	1998	1999	Liabilities & Equity	1998	1999
Current Assets	4	5	Current Liabilities		
Cash	4	5	Bank Loans	5	0
Mark Securities	0	5	Accts Payable	20	27

less Depr	16	20			
Net Fixed Assets	40	50	Total Liab and	V.	~~~
Total Assets	95	115	owner's equity	95	115

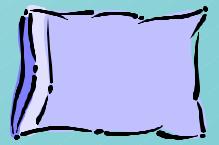

## Changes in Cash & W.C.

#### Example - Dynamic Mattress Company

Income Statement

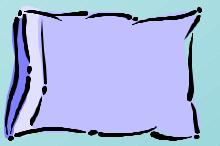

Sales	\$350
Operating Costs	321
Depreciation	4
EBIT	25
Interest	1
Pretax income	24
. Tax at 50%	12
Net Income	\$12

Assume dividend = \$1 mil R.E.=\$11 mil

## Changes in Cash & W.C.

Example -Dynamic Mattress Company

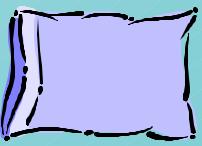

bources	
Issued long term debt	7
Reduced inventories	1
Increased accounts payable	7
Cash from operations	
Net income	12
Depreciation	4
Fotal Sources	\$31
Uses	
Repaid short term bank loan	5
Invested in fixed assets	14
Purchased marketable securities	5
Increased accounts receivable	5
Dividend	1
Fotal Uses	\$30
Increase in cash balance	\$1

Example - Dynamic Mattress Company

Dynamic used cash as follows:

- Paid \$1 mil dividend.
- Repaid \$5 mil short term bank loan.
- Invested \$14 mil.
- Purchased \$5 mil of marketable securities.
- Accounts receivable expanded by \$5 mil.

- Steps to preparing a cash budget
- Step 1 Forecast the sources of cash.
- Step 2 Forecast uses of cash.
- Step 3 Calculate whether the firm is facing a cash shortage or surplus.

Example - Dynamic Mattress Company

Dynamic forecasted sources of cash

#### **Principles of Corporate Finance**

**Brealey and Myers** 

**Sixth Edition** 

Credit Management

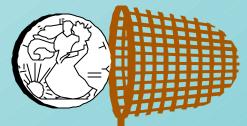

### **Chapter 30**

# **Topics Covered**

- Terms of Sale
- Commercial Credit Instruments
- Credit Analysis
- The Credit Decision
- Collection Policy
- Bankruptcy

<u>**Terms of Sale</u>** - Credit, discount, and payment terms offered on a sale.</u>

**Example** - 5/10 net 30

5 - percent discount for early payment
10 - number of days that the discount is available *net 30* - number of days before payment is due

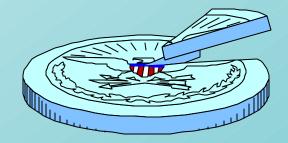

- A firm that buys on credit is in effect borrowing from its supplier. It saves cash today but will have to pay later. This, of course, is an implicit loan from the supplier.
- We can calculate the implicit cost of this loan.

- A firm that buys on credit is in effect borrowing from its supplier. It saves cash today but will have to pay later. This, of course, is an implicit loan from the supplier.
- We can calculate the implicit cost of this loan

Effective annual rate =  $\left(1 + \frac{\text{discount}}{\text{discounted price}}\right)^{365/\text{extra days credit}}$ 

# **Example** - On a \$100 sale, with terms 5/10 net 60, what is the implied interest rate on the credit given?

**Example** - On a \$100 sale, with terms 5/10 net 60, what is the implied interest rate on the credit given?

# Effective annual rate

 $= \left(1 + \frac{\text{discount}}{\text{discounted price}}\right)^{365/\text{extra days credit}} - 1$ 

 $=\left(1+\frac{5}{95}\right)^{365/50}$  -1 = .454, or 45.4%

### **Credit Instruments**

- Terminology
  - → open account
  - → promissory note
  - → commercial draft
  - → sight draft
  - → time draft
  - → trade acceptance
  - → banker's acceptance

<u>**Credit Analysis</u>** - Procedure to determine the likelihood a customer will pay its bills.</u>

- Credit agencies, such as Dun & Bradstreet provide reports on the credit worthiness of a potential customer.
- Financial ratios can be calculated to help determine a customer's ability to pay its bills.

Numerical Credit Scoring categories

- → The customer's *character*
- → The customer's *capacity* to pay
- → The customer's *capital*
- → The *collateral* provided by the customer
- → The *condition* of the customer's business

Multiple Discriminant Analysis - A technique used to develop a measurement of solvency, sometimes called a *Z Score*. Edward Altman developed a Z Score formula that was able to identify bankrupt firms approximately 95% of the time.

Multiple Discriminant Analysis - A technique used to develop a measurement of solvency, sometimes called a *Z Score*. Edward Altman developed a Z Score formula that was able to identify bankrupt firms approximately 95% of the time.

Altman Z Score formula

 $Z = 3.3 \frac{\text{EBIT}}{\text{total assets}} + 1.0 \frac{\text{sales}}{\text{total assets}} + .6 \frac{\text{market value of equity}}{\text{total book debt}}$  $+ 1.4 \frac{\text{retained earnings}}{\text{total assets}} + 1.2 \frac{\text{working capital}}{\text{total assets}}$ 

**Example** - If the Altman Z score cut off for a credit worthy business is 2.7 or higher, would we accept the following client?

**Example** - If the Altman Z score cut off for a credit worthy business is 2.7 or higher, would we accept the following client?

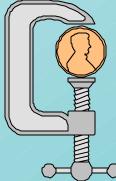

EBIT retained earnings = 1.2 = 4 total assets total assets sales = 14working capital = 12total assets total assets market equity = 9 book debt

**Example** - If the Altman Z score cut off for a credit worthy business is 2.7 or higher, would we accept the following client?

Firm' s Z Score (3.3x.12) + (1.0x1.4) + (..6x.9) + (1.4x.4) + (1.2x.12) = 3.04

A score above 2.7 indicates good credit.

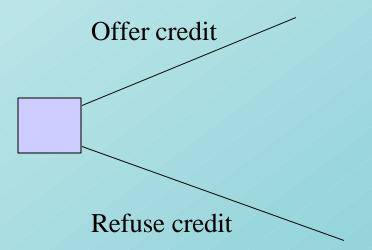

- Credit analysis is only worth while if the expected savings exceed the cost.
  - → Don't undertake a full credit analysis unless the order is big enough to justify it.
  - → Undertake a full credit analysis for the doubtful orders only.

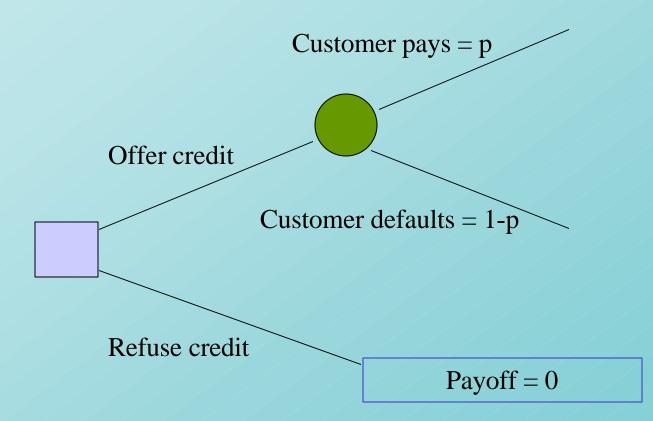

**Credit Policy** - Standards set to determine the amount and nature of credit to extend to customers.

- Extending credit gives you the probability of making a profit, not the guarantee. There is still a chance of default.
- Denying credit guarantees neither profit or loss.

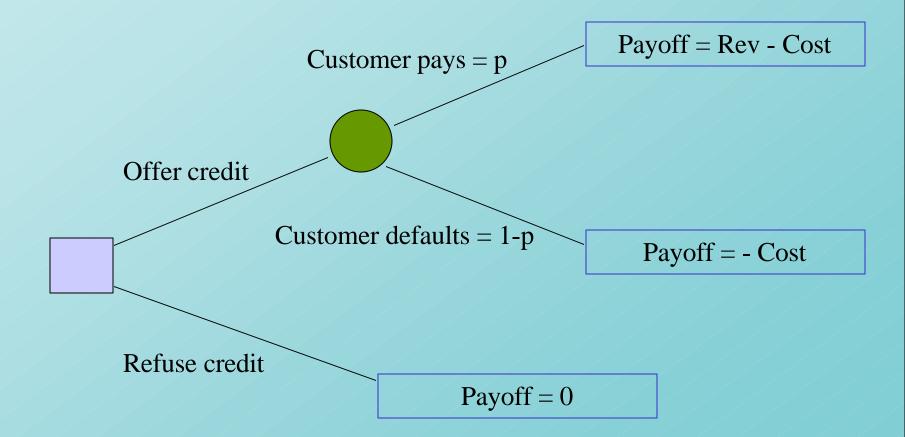

#### The credit decision and its probable payoffs

#### The credit decision and its probable payoffs

#### The credit decision and its probable payoffs

• Based on the probability of payoffs, the expected profit can be expressed as:

• Based on the probability of payoffs, the expected profit can be expressed as:

 $p \ge PV(Rev - Cost) - (1 - p) \ge (PV(cost))$ 

• Based on the probability of payoffs, the expected profit can be expressed as:

 $p \ge PV(Rev - Cost) - (1 - p) \ge (PV(cost))$ 

The break even probability of collection is:

$$p = \frac{PV(Cost)}{PV(Rev)}$$

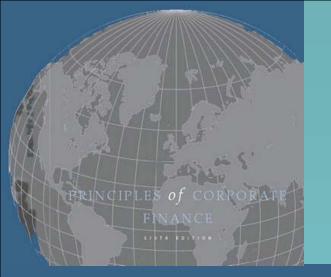

**Collection Policy** - Procedures to collect and monitor receivables.

Aging Schedule - Classification of accounts receivable by time outstanding.

# **Collection Policy**

#### Sample aging schedule for accounts receivable

Customer's	Amount Not	1 Month	More than 1	Total	
Name	Yet Due	Overdue	Month Overdue	Owed	
Alpha	10,000	0	0	10,000	
Beta	0	0	5,000	5,000	
*	*	*	*	*	
*	*	*	*	*	
*	*	*	*	*	
Omega	5,000	4,000	21,000	30,000	
Total	\$200,000	\$40,000	\$58,000	\$298,000	

#### **Principles of Corporate Finance**

**Brealey and Myers** 

**Sixth Edition** 

### **Chapter 31**

# **Topics Covered**

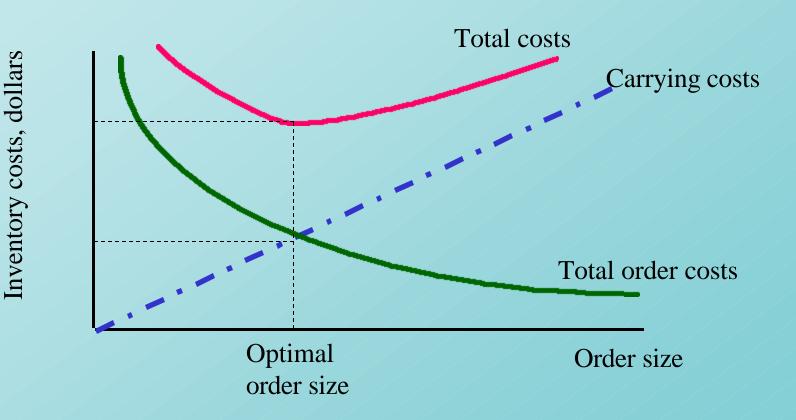

- Inventories and Cash Balances
- ◆ Cash Collection and Disbursement Systems
   → Float
- Bank Relations

#### **Economic Order Quantity** - Order size that minimizes total inventory costs.

Economic Order Quantity =

 $\frac{2 \text{ x annual sales x cost per order}}{\text{carrying cost}}$ 

#### Determination of optimal order size

 The optimal amount of short term securities sold to raise cash will be higher when annual cash outflows are higher and when the cost per sale of securities is higher. Conversely, the initial cash balance falls when the interest is higher.

Initial cash balance =  $\sqrt{-2}$ 

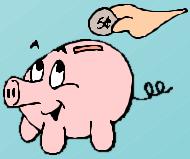

2 x annual cash outflows x cost per sale of securities interest rate

- Money Market market for short term financial assets.
  - → commercial paper
  - → certificates of deposit
  - → repurchase agreements

### Float

- Time exists between the moment a check is written and the moment the funds are deposited in the recipient's account.
- This time spread is called *Float*.

**<u>Payment Float</u>** - Checks written by a company that have not yet cleared.

Availability Float - Checks already deposited that have not yet cleared.

**Payment Float illustration** - The company issues a \$200,000 check that has not yet cleared.

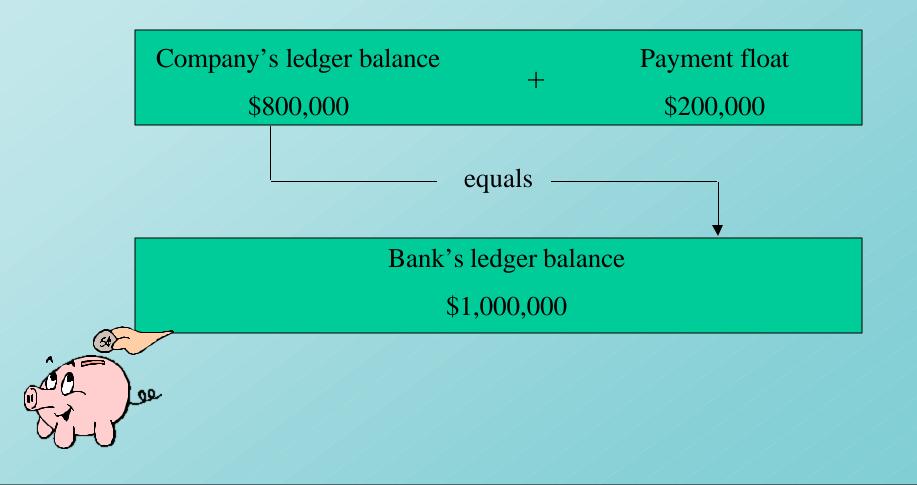

**Payment Float illustration** - The company issues a \$200,000 check that has not yet cleared.

Company's ledger balancePayment float\$800,000\$200,000

**Payment Float illustration** - The company issues a \$200,000 check that has not yet cleared.

<u>Availability Float illustration</u> - The company deposits a \$100,000 check that has not yet cleared.

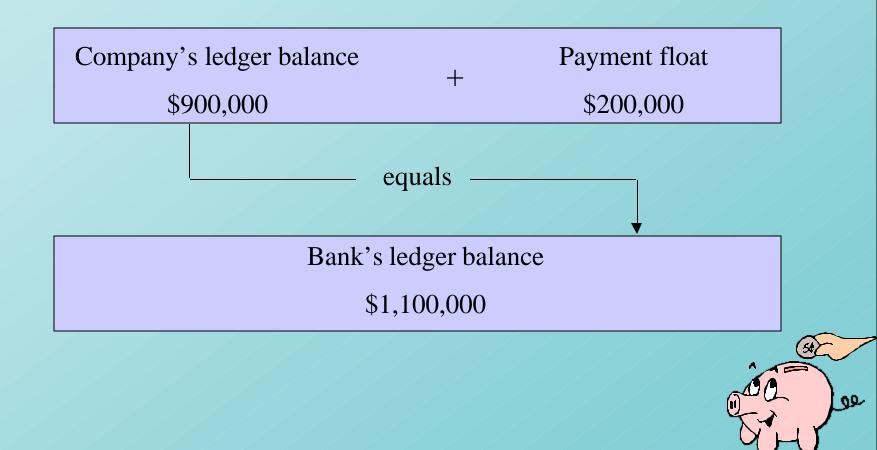

# <u>Availability Float illustration</u> - The company deposits a \$100,000 check that has not yet cleared.

Company's ledger balance	+	Payment float
\$900,000	I	\$200,000

# <u>Availability Float illustration</u> - The company deposits a \$100,000 check that has not yet cleared.

### **Net Float illustration**

Net float = payment float - availability float

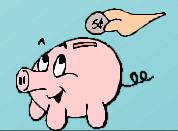

### **Net Float illustration**

### Net float = payment float - availability float

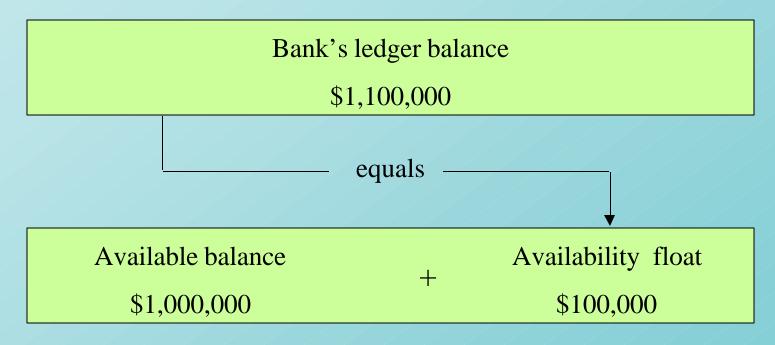

Bank's ledger balance

#### \$1,100,000

### **Net Float illustration**

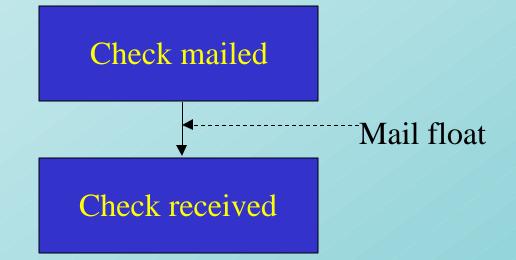

### Net float = payment float - availability float

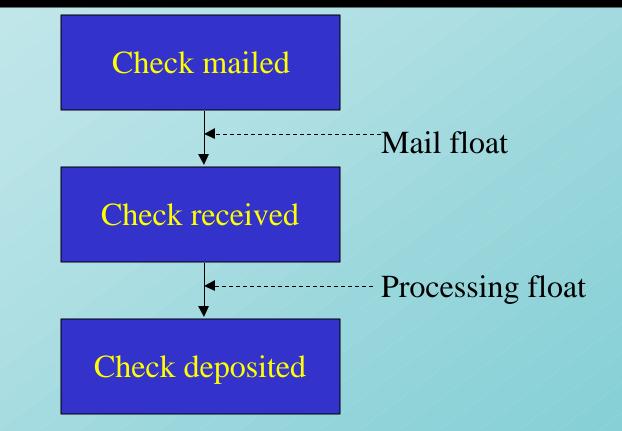

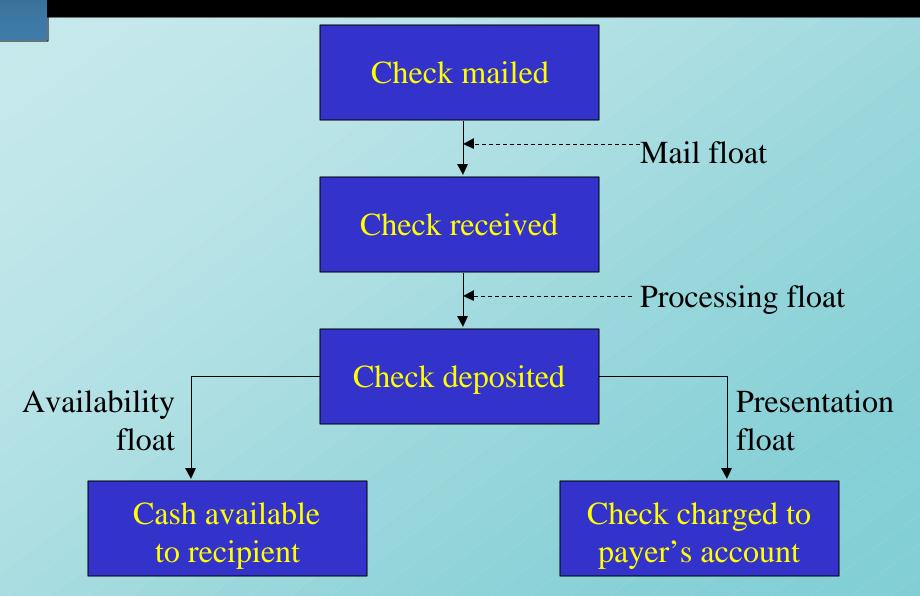

- Payers attempt to create delays in the check clearing process.
- Recipients attempt to remove delays in the check clearing process.
- Sources of delay
  - → Time it takes to mail check
  - → Time for recipient to process check
  - → Time for bank to clear check

Check mailed

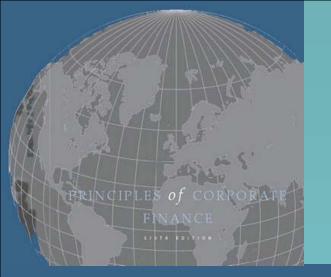

<u>Concentration Banking</u> - system whereby customers make payments to a regional collection center which transfers the funds to a principal bank.

- Lock-Box System System whereby customers send payments to a post office box and a local bank collects and processes checks.
- Zero-Balance Accounts Regional bank accounts to which just enough funds are transferred daily to pay each day's bills.

### **Principles of Corporate Finance**

**Brealey and Myers** 

**Sixth Edition** 

### Short Term Lending and Borrowing

## **Chapter 32**

# **Topics Covered**

- Short-Term Lending
- Money Market Instruments
- Floating Rate Preferred Stock
- Short Term Borrowing

# **Sources of Short Term Financing**

- Money Markets
- Commercial paper
- Secured loans
- Eurodollars

## **Cost of Short-Term Loans**

### **Simple Interest**

Amount of loan X

annual interest rate

number of periods in the year

## **Cost of Short-Term Loans**

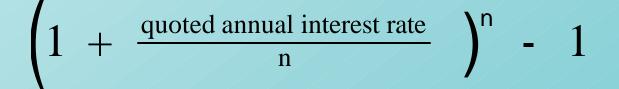

### **Simple Interest**

Amount of loan X

annual interest rate

number of periods in the year

**Effective annual rate** 

## **Cost of Short-Term Loans**

### **Discount Interest**

# Face value of loan $X(1 - \frac{\text{quoted annual interest rate}}{\text{number of periods in the year}})$

# **Calculating Yields**

### Example

In January of 1999, 91-day T-bills were issued at a discount of 4.36%.

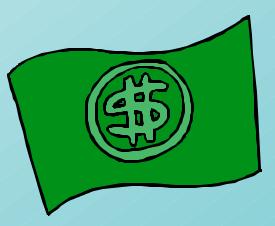

- 1. Price of bill =  $100 \frac{91}{360} \times 4.36 = 98.898$
- 2. 91-day return = (100 98.898) / 98.898 = 1.11%
- 3. Annual return = 1.11 x 365/91 = 4.47% simple interest *or*

 $(1.0111)^{365/91} - 1 = 4.55\%$  compound interest

# **Money Market Investments**

- US Treasury Bills
- Federal Agency Securities
- Short-Term Tax-Exempts
- Bank Time Deposits and CDs
- Commercial Paper
- Medium Term Notes
- Bankers' Acceptances

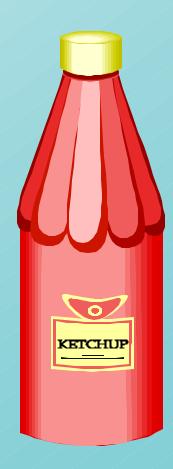

# **Credit Rationing**

### Example - Henrietta Ketchup

	Investments	Payoff	Prob. of Payoff
Project 1	-12	15	1
Project 2	-12	24 or 0	.5 or .5

# **Credit Rationing**

#### Example - Henrietta Ketchup

	Expected Payoff to Bank	Expected Payoff to Ms. Ketchup	
Project 1	110	15	
Project 2	(.5x10) + (.5x0) = +5	.5 x (24-10) = +7	

KETCHU

# **Credit Rationing**

#### Example - Henrietta Ketchup

	Expected Payoff to Bank	Expected Payoff to Ms. Ketchup	
Project 1	5	10	
Project 2	(.5x5) + (.5x0) = +2.5	.5 x (24-5) = +9.5	

KETCHU

### **Principles of Corporate Finance**

**Brealey and Myers** 

**Sixth Edition** 

# **Chapter 33**

# **Topics Covered**

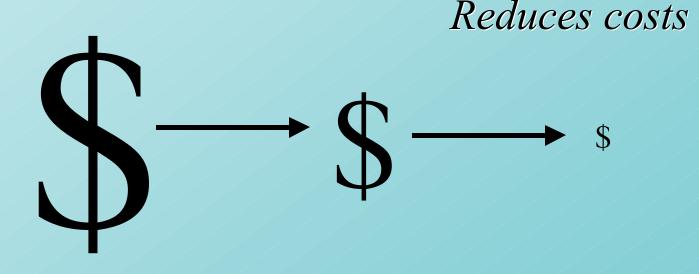

- Sensible Motives for Mergers
- Some Dubious Reasons for Mergers
- Estimating Merger Gains and Costs
- The Mechanics of a Merger
- Takeover Battles
- Mergers and the Economy

# 1997 and 1998 Mergers

Selling Company	Acquiring Company	Payment, billions of dollars
NYNEX	Bell Atlantic	21.0
McDonnell Douglas	Boeing	13.4
Digital Equipment	Compaq Computer	9.1
Schweizerischer	Union Bank of Swiz.	23.0
Energy Group PCC	Texas Utilities	11.0
Amoco Corp.	British Petroleum	48.2
Sun America	American Intl.	18.0
BankAmerica Corp.	Nationsbank Corp.	61.6
Chrysler	Daimler-Benz	38.3
Bankers Trust Corp.	Deutsche Bank AG	9.7
Netscape	America Online	4.2
Citicorp	Travelers Group Inc.	83.0

### **Economies of Scale**

A larger firm may be able to reduce its per unit cost by using excess capacity or spreading fixed costs across more units.

### **Economies of Vertical Integration**

- → Control over suppliers "may" reduce costs.
- $\rightarrow$  Over integration can cause the opposite effect.

### **Economies of Vertical Integration**

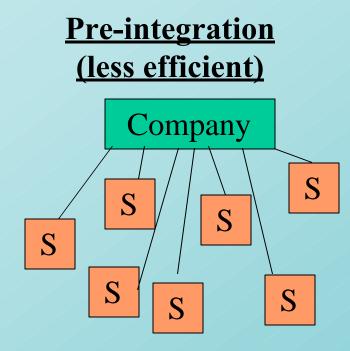

S

- → Control over suppliers "may" reduce costs.
- $\rightarrow$  Over integration can cause the opposite effect.
- Pre-integration (less efficient) Company S S S S

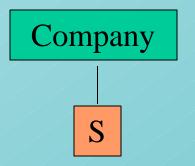

S

### **Economies of Vertical Integration**

- → Control over suppliers "may" reduce costs.
- $\rightarrow$  Over integration can cause the opposite effect.

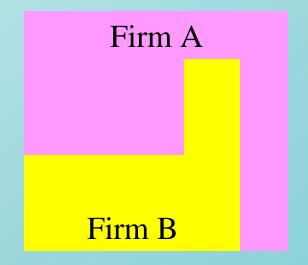

### **Combining Complementary Resources**

Merging may result in each firm filling in the "missing pieces" of their firm with pieces from the other firm.

### **Combining Complementary Resources**

Merging may result in each firm filling in the "missing pieces" of their firm with pieces from the other firm.

### **Mergers as a Use for Surplus Funds**

If your firm is in a mature industry with few, if any, positive NPV projects available, acquisition may be the best use of your funds.

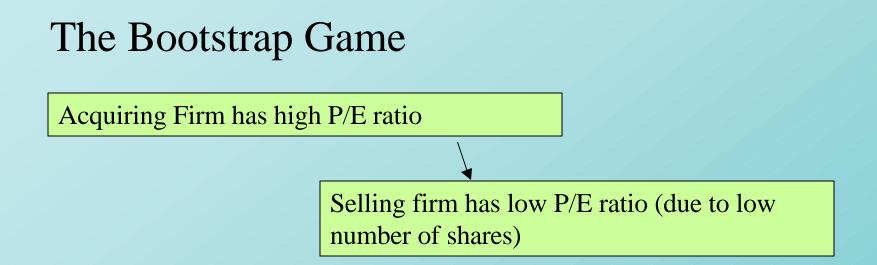

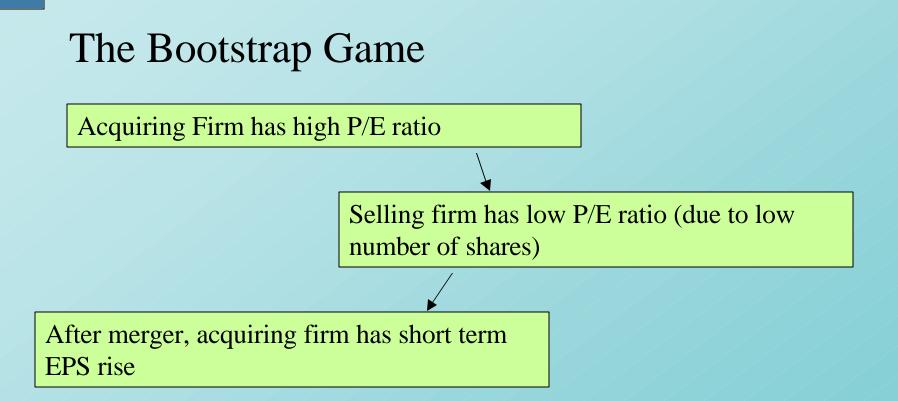

Diversification

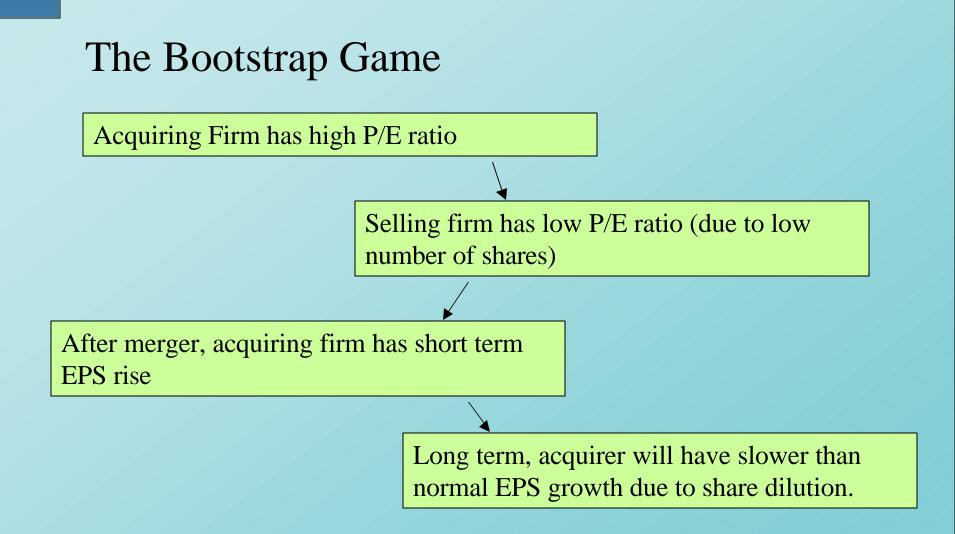

→ Investors should not pay a premium for diversification since they can do it themselves.

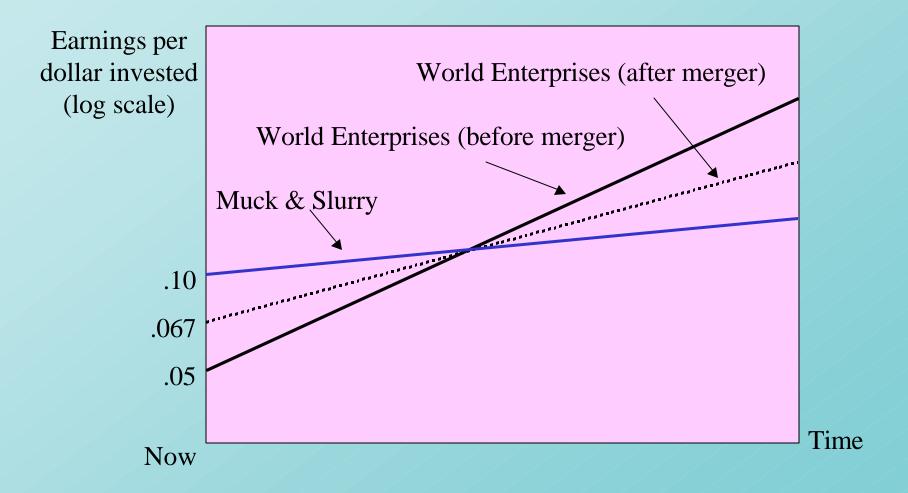

#### The Bootstrap Game

Acquiring Firm has high P/E ratio

# **Estimating Merger Gains**

#### Questions

- $\rightarrow$  Is there an overall economic gain to the merger?
- → Do the terms of the merger make the company and its shareholders better off?

????

#### PV(AB) > PV(A) + PV(B)

## **Estimating Merger Gains**

Economic Gain

Economic Gain = PV(increased earnings)

New cash flows from synergies discount rate

#### **Takeover Defenses**

White Knight - Friendly potential acquirer sought by a target company threatened by an unwelcome suitor.

<u>Shark Repellent</u> - Amendments to a company charter made to forestall takeover attempts.

**Poison Pill** - Measure taken by a target firm to avoid acquisition; for example, the right for existing shareholders to buy additional shares at an attractive price if a bidder acquires a large holding.

#### **Principles of Corporate Finance**

**Brealey and Myers** 

**Sixth Edition** 

#### Control, Governance, and Financial Architecture

#### **Chapter 34**

# **Topics Covered**

- Leveraged Buyouts
- Spin-offs and Restructuring
- Conglomerates
- Private Equity Partnership
- Control and Governance

#### Definitions

- Corporate control -- the power to make investment and financing decisions.
- Corporate governance -- the role of the Board of Directors, shareholder voting, proxy fights, etc. and the actions taken by shareholders to influence corporate decisions.
- Financial architecture -- the financial organization of the business.

• The difference between leveraged buyouts and ordinary acquisitions:

- 1. A large fraction of the purchase price is debt financed.
- 2. The LBO goes private, and its share is no longer trade on the open market.

## **Leveraged Buyouts**

The three main characteristics of LBOs:

- 1. High debt
- 2. Incentives
- 3. Private ownership

#### **Leveraged Buyouts**

#### 10 Largest LBOs in 1980s and 1997/98 examples

Acquirer	Target	Year	P	rice (\$bil)
KKR	RJR Nabisco	1989	\$	24.72
KKR	Beatrice	1986	\$	6.25
KKR	Safeway	1986	\$	4.24
Thompson Co.	Southland	1987	\$	4.00
AV Holdings	Borg-Warner	1987	\$	3.76
Wing Holdings	NWA, Inc.	1989	\$	3.69
KKR	Owens-Illinois	1987	\$	3.69
TF Investments	Hospital Corp of America	1989	\$	3.69
FH Acquisitions	For Howard Corp.	1988	\$	3.59
Macy Acquisition Corp.	RH Macy & Co	1986	\$	3.50
Bain Capital	Sealy Corp.	1997	\$	811.20
Citicorp Venture Capital	Neenah Corp.	1997	\$	250.00
Cyprus Group (w/mgmt)	WESCO Distribution Inc.	1998	\$	1,100.00
Clayton, Dublier & Rice	North Maerican Van Lines	1998	\$	200.00
Clayton, Dublier & Rice (w/mgmt)	Dynatech Corp.	1998	\$	762.90
Kohlberg & Co. (w.mgmt)	Helley Performance Products	1998	\$	100.00

### Spin-offs, etc.

- Spin off -- debut independent company created by detaching part of a parent company's assets and operations.
- Carve-outs-- similar to spin offs, except that shares in the new company are not given to existing shareholders but sold in a public offering.
- Privatization -- the sale of a governmentowned company to private investors.

#### **Privatization**

• Motives for *Privatization*:

- 1. Increased efficiency
- 2. Share ownership
- 3. Revenue for the government

#### **Privatization**

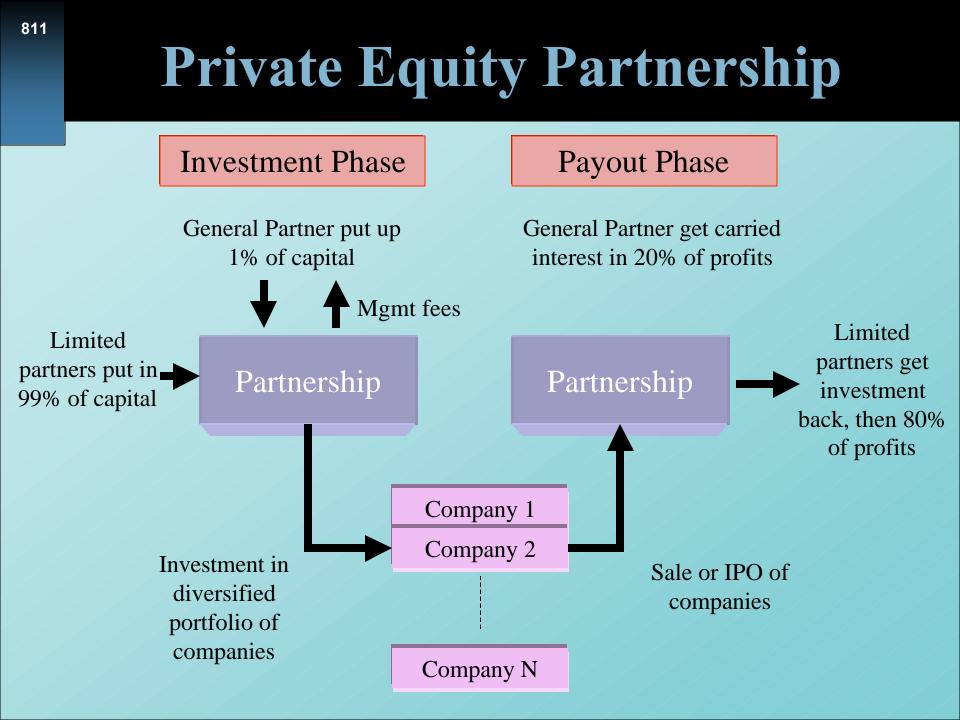

#### **Examples of Privatization**

		Amount Issued,	
Country	Company and Date	\$ millions	
France	St. Gobain (1986)	\$	2,091.40
France	Paribas (1987)	\$	2,742.00
Germany	Volkswagon (1961)	\$	315.00
Jamaica	Caribbean Cement (1987)	\$	45.60
Jpan	Japan Airlines (1987)	\$	2,600.00
Mexico	Telefonos de Mexico (1990)	\$	3,760.00
New Zealand	Air New Zealand (1989)	\$	99.10
Singapore	Neptune Orient Lines (1981-1988)	\$	308.50
United Kingdom	British Gas (1986)	\$	8,012.00
United Kingdom	BAA (Airports)(1987)	\$	2,028.00
United Kingdom	British Steel (1988)	\$	4,524.00
United States	Conrail (1987)	\$	1,650.00

# Conglomerates

#### The largest US conglomerates in 1979

Sales Rank	Company	Numebr of Industries
8	ITT	38
15	Tenneco	28
42	Gulf & Western Industries	41
51	Litton Industries	19
66	LTV	18
73	<b>Illinois Central Industries</b>	26
103	Textron	16
104	Greyhound	19
